Foreword

© Emmanuel Berrod/WIPO

It is my great pleasure to introduce this year's *Global Innovation Index* (GII), now in its 14th edition, presenting the worldwide innovation landscape and annual performance rankings of some 130 economies.

This year's edition is being released in the middle of a continuing COVID-19 pandemic, which has taken a grim toll on lives and livelihoods, but also given us many examples of human ingenuity, resilience and adaptability. Indeed, the *GII 2021* finds that the innovative sectors of the global economy have remained strong, despite severe disruptions.

To overcome the pandemic and build back better, we will need to continue supporting the translation of great ideas into game-changing products. How do we do this? This is the ultimate goal of the *GII*: to discover what works best in producing an ecosystem where people can achieve their highest potential, innovating and creating to improve lives everywhere.

The *GII 2021* finds that governments and enterprises in many parts of the world have scaled up their investments in innovation during the COVID-19 pandemic. Meantime, scientific output, expenditures in research and development, intellectual property filings and venture capital deals continued to grow in 2020, building on strong peak pre-crisis performance.

But much more effort will be needed to vanquish the pandemic – and the *GII* can help. The *GII*'s overall formula for measuring an economy's innovative capacity and output provides clarity for decision-makers in government, business and elsewhere as they look forward to creating policies that enable their people to invent and create more efficiently. That's key to overcoming the pandemic and building back better.

In the last decade and a half since its inception, the *GII* has supported countries around the globe as they improve their innovation investments and related policies. Dozens of countries from all regions and income groups already actively use the *GII* framework in the construction of their pro-innovation policies. It has charted the rising understanding of how important innovation is to growth in an interconnected but competitive worldwide economy.

As we look toward the exit of the current crisis, let us focus on using innovation to deepen the transformation of our economies and societies for the good of all. The pandemic has already accelerated digital ways of working, living and playing, while boosting technology trends all over the world. In this future world where technology, innovation and creativity are even more important for the global economy, it is my hope that the *GII* will continue to help guide policymakers and others so that we can build back better.

Daren Tang

Director General,
World Intellectual Property
Organization (WIPO)

Acknowledgments

The *Global Innovation Index 2021* was prepared under the general direction of Daren Tang, Director General, in WIPO's IP and Innovation Ecosystems Sector led by Marco Alemán, Assistant Director General, and in the Department of Economics and Data Analytics led by Carsten Fink, Chief Economist.

The report and rankings are produced by a core team managed by Sacha Wunsch-Vincent, Head of Section, comprising Vanessa Behrens, Project Manager, Jack Gregory, Innovation Data Analyst, and Lorena Rivera León, Economist, from the WIPO Composite Indicator Research Section, and the following consultants: William Becker, Rafael Escalona Reynoso and Antanina Garanasvili.

Soumitra Dutta (Cornell University and Portulans Institute), Bruno Lanvin (Institut Européen d'Administration des Affaires, INSEAD and Portulans Institute), Lorena Rivera León (WIPO) and Sacha Wunsch-Vincent (WIPO) serve as co-editors of the GII.

The following WIPO colleagues provided substantive inputs: Hao Zhou, Director of Statistics, and Kyle Bergquist, Data Analyst, from the Statistics and Data Analytics Division, as well as colleagues from the External Relations Division, the Information and Digital Outreach Division, the IP and Innovation Ecosystems Sector, the Language Division, the News and Media Division, the Printing Plant, the Regional and National Development Sector, the WIPO Office in New York and China, WIPO's External Offices, as well as WIPO's Special Representative on the UN Sustainable Development Goals (SDGs).

A special thank you goes to the GII's Advisory Board, Corporate Network and Academic Network for their participation, as well as to the Competence Centre on Composite Indicators and Scoreboards (COIN) team from the European Commission's Joint Research Centre that conducted the statistical audit. The report was edited by Richard Cook and Andy Platts. Gratitude is also due to the creative production of the GII website carried out by StratAgile PTE Ltd.

We are grateful to the following individuals and institutions for their collaboration with data requests, and without whom the Index would not be what it is:

App Annie: Donny Kristianto and Lexi Sydow

Brand Finance: David Haigh and Parul Soni

Bureau van Dijk , Moody Analytics: Santhosh Metri and Petra Steiner

Clarivate Analytics: Bastien Blondin and Joseph Brightbill

Eurostat, European Commission: Jose da Silva Paredes and Sorina Vaju

Gallup: Kiki Papachristoforou, Andrew Rzepa and Christine Sheehan

Global Entrepreneurship Monitor (GEM): Niels Bosma, Jonathan Carmona, Aileen Ionescu-Somers and Forrest Wright

IHS Markit: Mohsen Bonakdarpour and Karen Campbell

International Energy Agency (IEA): Nicolas Coënt, Taylor Morrison, Roberta Quadrelli and Céline Rouquette

International Labour Organization (ILO): Yves Perardel

International Monetary Fund (IMF)

International Organization for Standardization (ISO): Laurent Charlet and Cristina Draghici

International Telecommunication Union (ITU): Thierry Geiger, Esperanza Magpantay and Martin Schaaper

Joint Research Centre of the European Commission: Giulio Caperna, Giacomo Damioli, Valentina Montalto, Ana Rita Neves and Michaela Saisana from COIN; and Nicola Grassano and Héctor Hernández

National Science Foundation (NSF): Derek Hill

Organisation for Economic Co-operation and Development (OECD): Frédéric Bourassa, Miyako Ikeda, Caroline Paunov, Andreas Schleicher, Fabien Verger and Verena Weber

PricewaterhouseCoopers (PwC): Angela Suh and Ashley Worley

QS Quacquarelli Symonds Ltd: Selina Griffin, Andrew MacFarlane, Ben Sowter and Dennis Yu

Refinitiv: Cornelia Andersson, Richard Blachford, Sylvain Freneat, John-Philippe Lalive and Paul Metcalfe

SCImago: Félix de Moya Anegón

Statista: Jon Nielsen and Friedrich Schwandt

The Conference Board: Klaas de Vries

Trade Data Monitor LLC: C. Donald Brasher Jr., Adam McCune, John Miller and Altan Yurdakul

UNESCO Institute for Statistics (UIS): Maria Helena Capelli Miguel, Lydia Deloumeaux, Talal El Hourani, Rohan Pathirage and José Pessoa

United Nations Commodity Trade Statistics Database

United Nations Industrial Development Organization (UNIDO): Fernando Cantu Bazaldua, Martin Haitzmann and Valentin Todorov

United Nations Public Administration Network

Wikimedia Foundation: Dan Andreescu, Diego Sáez-Trumper and Leila Zia

World Bank: Robert Cull, Frederic Meunier, Jorge Rodríguez Meza and Christina Wiederer

World Economic Forum: Sophie Brown and Roberto Crotti

World Federation of Exchanges: Mihaela Croitoru

World Trade Organization (WTO): Barbara D'Andrea Adrian, Christophe Degain, Florian Eberth and Ying Yan

Yale University: Zachary Wendling

ZookNIC Inc: Matthew Zook

Advisory Board

In 2011, an Advisory Board was established to advise on the strategic direction of the GII, to help emphasize the role played by innovation in economic and social development, and to assist with the dissemination of GII results. The Advisory Board is a select group of international policymakers, thought-leaders and corporate executives. Members are drawn from diverse geographical and institutional backgrounds and participate in a personal capacity. We extend our gratitude to all Advisory Board members for their continued support and collaboration.

As departing members of the Advisory Board, we thank Dongmin Chen, Yuko Harayama, Beethika Khan, Chuan Poh Lim, Mary O'Kane and Sibusiso Sibisi for their contribution to previous editions of the GII.

Advisory Board members

Clare Akamanzi

Chief Executive Officer, Rwanda Development Board, Rwanda

Robert D. Atkinson

President, Information Technology and Innovation Foundation (ITIF), United States of America (U.S.)

Audrey Azoulay

Director-General, United Nations Educational, Scientific and Cultural Organization (UNESCO)

Amy L. Burke

Program Director, Science and Engineering Indicators Program, National Center for Science & Engineering Statistics, National Science Foundation (NSF), United States of America (U.S.)

Fabiola Gianotti

Director General, European Organization for Nuclear Research (CERN)

Secretary-General, International Telecommunication Union (ITU)

The GII Partners

Foreword

Soumitra Dutta and Bruno Lanvin
Co-editors of the *Global Innovation Index*
Co-founders of the Portulans Institute

In more than one respect, the year that has elapsed between the 2020 edition of the *Global Innovation Index* (GII) and the present one has been eventful and disruptive. The sudden outbreak of the COVID-19 pandemic has fundamentally altered the ways in which the world lives, works and learns. Innovation is changing in the post-pandemic era and the GI will continue to seek data-based validation of these changes.

As recovery packages continue to be deployed across major world economies, the fields of health, green and digital technology are attracting increased attention and funding. Advances and innovations can be expected in critical areas, such as health (for example, genetic engineering), pharmaceuticals (especially vaccines), energy production (with a focus on renewables), logistics and urban design, all powered by breakthroughs in artificial intelligence and quantum computing. The last edition of the GI laid out specific needs for entrepreneurship financing and measures to integrate innovation into post-crisis strategies. However, the jury is still out on the adequacy and effectiveness of the recovery packages and economic stimulus measures recently announced.

It is likely that innovation divides will be accentuated in the coming years, across economies, sectors and companies. Innovation ecosystems in many emerging economies have become fragile and will need to be supported by targeted policies. While sectors such as ICT, software and pharmaceuticals have increased spending on R&D in 2020, others

such as hospitality and automobiles, have reduced their R&D investments over the same period. This imbalance will need to be corrected as the future winners in all sectors will have to be innovative in terms of both new technologies and business models.

The GI report is now published by WIPO in partnership with the Portulans Institute, with the support of our corporate network partners, the Confederation of Indian Industry (CII), Brazilian National Confederation of Industry (CNI), Ecopetrol Group (Colombia) and the Turkish Exporters Assembly (TIM). The GI will continue to provide factual evidence and reliable data to inform the many essential debates around innovation. Indeed, the 2021 edition of the GI proposes the use of a novel GI Global Innovation Tracker to monitor some of the issues mentioned above. This new effort is fully in line with the GI's goal of advancing a data-based understanding of innovation.

An important new element of the GI ecosystem this year is the creation of an Academic Network comprising nine important global academic institutions: American University in Cairo (Egypt), Cornell University (United States of America), EGADE Business School (Mexico), Higher School of Economics (Russian Federation), INSEAD (France/Singapore), Lagos Business School (Nigeria), Peking University (China), Universidad de Los Andes (Colombia) and University of São Paulo (Brazil). The GI Academic Network will play a key role in creating new innovation programs for faculties and students globally.

We look forward to a fruitful collaboration in growing the global impact of the GI under the new leadership of WIPO's Director General, Daren Tang, and creating new programs that focus on corporate innovation and young entrepreneurs.

Corporate Network

Chandrajit Banerjee
Director General
Confederation of Indian Industry (CII)

Innovation in a new world: Lives, livelihoods and an economic reboot

The unprecedented global crisis that resulted from the outbreak of COVID-19 has propelled us into reinvigorating the important dimension of innovation in order to mitigate the pandemic's profound adverse effects on the economy and restore growth, calling for nations to embrace innovation as never before. While the crisis has naturally stimulated interest in innovative health-care solutions, it has also catalyzed other areas, such as remote working, distance learning, e-commerce and mobility solutions.

India is well known for its close relationship with innovation, from developing low-cost vaccines to frugal space programmes, and safeguarding millions of lives through the development of effective warning systems for cyclones. In these challenging times, the Confederation of Indian Industry (CII) has been working around the clock alongside the Indian Government and industry to combat the impact of the pandemic through policy advocacy, production and dissemination of appropriate technology by industry, creation and augmentation of medical infrastructure, and numerous other interventions.

Over the years, the *Global Innovation Index* (GII) has been instrumental in allowing India to shape its policies and design an actionable agenda for innovation excellence. It is indeed both a privilege and an honour for the CII to host the Indian launch of the GI every year and the historic global launch in 2019. The GI launch is a clear indicator of the phenomenal recognition of India's standing in innovation.

As nations formulate appropriate strategies for saving lives and design economic growth trajectories, the GI 2021 report will provide a significant reference point, allowing countries to assess their innovation capabilities, potential, readiness and resilience, not only to fight the current and future crises, but also to seek economic recovery and to create business models that will survive and thrive in the new post-pandemic world.

I appreciate the tireless efforts of the GI team in producing this latest edition of the Index during the crisis. The CII is privileged to have been associated with the GI since its inception and we believe it will continue to aid the global innovation journey.

I congratulate the GI team and wish them all the very best.

Robson Braga de Andrade
President
Brazilian National Confederation of
industry (CNI)

Innovation: A vaccine to boost Brazil's competitiveness

The COVID-19 pandemic has triggered severe health and economic crises that will have lasting impacts. Vaccine research and scientific investigation to prevent the spread of coronavirus have increased awareness of the pivotal role of science, technology and innovation (STI) in economic and social development.

Brazil has yet to put STI at the heart of its long-term development strategy. The necessity of prioritizing the provision of public services is often used to justify a lack of focus on STI spending. Difficulties in public budget management, combined with deep-seated structural economic problems and a lack of long-term vision further exacerbate this situation.

The Entrepreneurial Mobilization for Innovation (MEI), a group coordinated by the Brazilian National Confederation of Industry (CNI), comprising 300 of the top business leaders in the country, advocates that innovation is fundamental in promoting sustainable growth and addressing chronic problems, including the provision of basic services. MEI operates as a space for public-private dialogue, allowing public policy proposals to improve the national innovation ecosystem to be presented and debated.

MEI has many achievements to show for its 13 years of existence, yet much still remains to be done. For Brazil to become a truly innovative economy, we need to be among the top 30 economies in the *Global Innovation Index* (GII) and the government's policy, launched in 2020, pledges to make concerted efforts toward achieving this goal.

MEI contributes to this national endeavor by means of specific agendas on STI policy and governance; regulatory framework; financing; strategic human resources; open innovation; sustainability; and digital transformation. The GI and other international benchmark studies are fundamental inputs on these fronts, providing an understanding of our strengths and identifying gaps.

CNI believes that the GI provides an important annual reference on innovation progress in different nations and, as such, offers excellent guidance to policymakers and companies in Brazil, contributing to the national debate, informing public-private dialogue and strengthening joint efforts toward a globally competitive Brazilian innovation ecosystem.

Have a great read!

Felipe Bayón Pardo
Chief Executive Officer
Ecopetrol Group

Committed to “making the impossible possible”

Ecopetrol began three years ago an unprecedented reinvention process. Digital transformation has played a fundamental role in making the Company what it is today: more efficient, more solid and more resilient to crises. In response to the energy transition, we have based our strategy on sustainability. In fact, at Ecopetrol we talk about TESH, whereby technology and innovation act as catalysts for the environmental, social and governance dimensions (ESG). We define TESH as making a long-term contribution and being a value generation model that aims for responsible, safe and efficient operations, harmonizing relations with the environment and our stakeholders under a transparent and ethical governance framework and using technology to develop innovative solutions to current and future challenges. In this way, we put technology and innovation at the heart of sustainability.

As an integrated business group, Ecopetrol is addressing the energy transition in four ways: i) by increasing the *competitiveness* of existing assets, ii) by *diversifying* into low-emissions businesses, iii) by accelerating *decarbonization* to achieve the goal of net zero carbon emissions by 2050, and iv) by deepening our TESH agenda. This is underpinned by the development of talent, knowledge and innovation. A key principle of our corporate culture is “Making the impossible possible, implementing innovative solutions with anticipation and technology,” thereby enhancing Ecopetrol’s goal of becoming the energy that transforms Colombia.

Our 2021–2023 Business Plan includes investments in technology and innovation of between US\$100 and US\$150 million. For this financial year, around US\$20 million has been allocated to the research and development of technologies for energy transition and carbon neutrality.

We at Ecopetrol are aware that we cannot do it all on our own, which is why we have been strengthening our working in partnership with both public and private entities, including Microsoft, IHS Markit, Plug and Play, Israel’s Innovation Authority, Colombia’s Ministry of Science, Technology and Innovation, and iNNpulsa Colombia. We have also created strategic alliances with young entrepreneurs to better face the multiple challenges that confront our industry.

We also require disruptive solutions. This is why we joined the *Global Innovation Index’s* (GII) Corporate Network. We are convinced that by working jointly with the best, we can continue to make the impossible possible for the benefit of the company, its stakeholders and an innovative Colombia.

İsmail Gülle

Chair

Turkish Exporters Assembly (TİM)

Innovation: A crucial indicator for Turkey's value-added export

Innovation is an instrument of development that plays an increasingly important role in global trade. Particularly over the past two decades, the arena of global trade has been changing, with economies of scale gradually being replaced by an innovation economy focused on high value-added products and services.

This shift in focus is why Turkey attributes great importance to innovation programs and monitoring tools, such as the *Global Innovation Index* (GII). Turkish exporters are making rapid progress toward their goal of becoming pioneers of innovation in every field. Over 100,000 exporting companies want to add innovation to their products and services.

The Turkish Exporters Assembly (TİM) is maintaining its support for innovation programs like InoSUIT, to strengthen university–industry cooperation, InovaLEAGUE, designed to identify innovation champions, InovaTİM, which educates students from 176 universities on the subject of innovation, and TİM-TEB Global House, which empowers 20 percent of all tech startups in Turkey and has raised more than 1,200 entrepreneurs. Additionally, we organize annual innovation events, such as Turkey Innovation Week – the largest gathering of the innovation ecosystem, coordinated by the Ministry of Commerce. Thanks to these programs, the number of Turkish exporters, specifically those with high value-added products, is gradually increasing.

With these long-established initiatives, TİM aims to improve Turkey's GII ranking and to realize the goals set out in the Turkish Global Innovation Index 2023 Roadmap, generated by TİM and the Ministry of Industry and Technology under the auspices of the Presidency of the Republic of Turkey. Inspired by the GII, a digital platform reports the monthly developments of 24 institutions for 69 GII indicators, and eight separate GII working committees have been set up to create medium- and long-term actions for the national roadmap. In this context, I would also like to thank the TİM Innovation Committee for their GII-focused efforts.

We wholeheartedly believe that, with the vital contribution of the GII, Turkey will continue in its endeavors to increase exports of innovative, high value-added products and services in a sustainable fashion.

Corporate Network Partners

Since its inception in 2007, the GII has been supported by Knowledge Partners drawn from the private sector; more specifically, firms, consultancies, or industry associations keen to promote innovation and spur competitiveness. Their contribution is an important source of influence for the GII – firms and private sector entities are, after all, at the heart of innovation. As of 2021, these partners constitute the GII's Corporate Network, supported by the Portulans Institute. In 2021, the GII Corporate Network comprises the Confederation of Indian Industry (the longest-standing corporate partner since 2008), the Brazilian National Confederation of Industry (a partner since 2017), as well as the Turkish Exporters Assembly and Ecopetrol Group, which both joined this year. We extend our gratitude to all corporate partners for their invaluable support.

Brazilian National Confederation of Industry (CNI)

Robson Braga de Andrade, President; Gianna Sagazio, Innovation Director; Cândida Oliveira, Innovation Executive Manager; Julieta Costa Cunha, Industrial Development Specialist.

Confederation of Indian Industry (CII)

Chandrajit Banerjee, Director General; S. Raghupathy, Deputy Director General; Ashish Mohan, Principal Counsellor and Head, Technology, Design, Research, Innovation & Intellectual Property Creation; Namita Bahl, Deputy Director, Technology & Innovation; Divya Arya, Executive Officer, Technology & Innovation.

Ecopetrol Group

Felipe Bayón Pardo, Chief Executive Officer of the Ecopetrol Group; Ernesto José Gutierrez de Piñeres Luna, Digital Vice President of Ecopetrol; William Jose Mora Villamizar, Head of department of digital factories.

Turkish Exporters Assembly (TİM)

Belma Ünal, Corporate Communication Director; Senem Sanal Sezerer, Deputy Secretary General; Kübra Ulutaş, Deputy Secretary General; Meltem Demirtaş, Chief; Gökhan Ezgin, Chief; and the following experts: Gülçin Yekin, Çağrı Köse, Burak Günaydin, Nebile Mercan.

Past corporate partners include Alcatel-Lucent, A.T. Kearney, Booz & Company, the Brazilian Micro and Small Business Support Service (SEBRAE), Canon, Dassault Systèmes, du (a telecommunications company), Huawei, IMP³rove – European Innovation Management Academy, PricewaterhouseCoopers (PwC), and strategy&.

Academic Network partners

In 2021, an Academic Network was established to engage world-leading universities – faculty members and graduate students included – in GII research and support the dissemination of GII results within the academic community. The Academic Network welcomes the contribution of researchers and institutions active in diverse fields, including business management, law, public policy and science. We extend our gratitude to all Academic Network partners for their support.

Brazil: University of São Paulo (USP), School of Economics, Management, Accounting and Actuarial Sciences, Moacir de Miranda Oliveira Júnior, Head, Business Administration Department

China: Peking University, Office of Science and Technology Development, Weihao Yao, Director

Colombia: Universidad de los Andes, School of Management, Veneta Stefanova Andonova Zuleta, Dean; and Carolina Davila Aranda, International Office Director

United States of America: Cornell SC Johnson College of Business, Soumitra Dutta, Professor and Former Founding Dean

GII 2021

GII 2021 at a glance

The Global Innovation Index 2021 captures the innovation ecosystem performance of 132 economies and tracks the most recent global innovation trends.

Top three innovation economies by region

Top three innovation economies by income group

High-income	Upper middle-income	Lower middle-income	Low-income
1. Switzerland 2. Sweden 3. United States of America	1. China 2. Bulgaria ↑ 3. Malaysia ↓	1. Viet Nam 2. India ↑ 3. Ukraine ↓	1. Rwanda ↑ 2. Tajikistan ☆ 3. Malawi ☆

↑↓ Indicates the movement of rank within the top three, relative to 2020, and

☆ indicates a new entrant into the top three in 2021.

* Top three in Northern Africa and Western Asia (NAWA) – excluding island economies. The top four in the region, including all economies, are as follows: Israel (1st), Cyprus (2nd), United Arab Emirates (3rd) and Turkey (4th).

* Top three in sub-Saharan Africa (SSA) – excluding island economies. The top five in the region comprise Mauritius (1st), South Africa (2nd), Kenya (3rd), Cabo Verde (4th) and the United Republic of Tanzania (5th).

Key takeaways

The state of innovation throughout the COVID-19 crisis

1. The GII 2021 finds that investment in innovation has shown great resilience during the COVID-19 pandemic, often reaching new peaks, but that it varies across sectors and regions

Investment in innovation reached an all-time high prior to the pandemic, with research and development (R&D) having grown an exceptional 8.5 percent in 2019.

When the pandemic hit, the big question was what its effect on innovation would be. Historical evidence suggested a severe cutback in innovation investments.

However, despite the human toll and the economic shock resulting from the pandemic, scientific output, R&D expenditure, IP filings and venture capital (VC) deals continued to grow in 2020, building on peak pre-crisis performance:

- Publication of scientific articles worldwide grew by 7.6 percent in 2020.
- Government budget allocations for the top R&D spending economies that have already disclosed their R&D budgets continued to grow in 2020. The top global corporate R&D spenders, for which data is available, grew overall R&D expenditure by around 10 percent in 2020, with 60 percent of R&D-intensive firms reporting an increase.
- International patent filings via WIPO reached a new all-time high in 2020. An increase of 3.5 percent was driven by medical technology, pharmaceuticals and biotechnology.
- VC deals grew by 5.8 percent in 2020, exceeding the average growth rate for the past 10 years. Strong growth in the Asia Pacific region more than compensated for declines in Northern America and Europe. Africa and Latin America and the Caribbean also registered double-digit increases. First quarter figures suggest VC activity will be even more vibrant in 2021.

Firms whose innovation was at the heart of measures to contain the pandemic and its fallout – notably (i) software and information and communication technology (ICT) services, (ii) ICT hardware and electrical equipment and (iii) pharmaceuticals and biotechnology – amplified their investments in innovation. Firms in sectors heavily hit by the pandemic's containment measures – such as transport and travel – cut back their innovation outlays.

However, despite such cutbacks, available data suggest that innovation investments overall proved resilient in the face of the pandemic; and especially so when compared to the depth of the economic downturn.

2. Technological progress at the frontier holds substantial promise

The rapid development of COVID-19 vaccines powerfully fulfills the promise of technological progress. Progress also continues apace in other technology fields – for example, ICT and renewable energy – with the potential to raise living standards, improve human health and protect the environment.

Results of the Global Innovation Index 2021

3. Only a few economies have consistently delivered peak innovation performance

- Switzerland, Sweden, the U.S., and the U.K. have all ranked among the top 5 in the past three years, while the Republic of Korea joins the top 5 of the GII for the first time in 2021.
- The majority of the GII top 25 most innovative economies continue to be from Europe.
- Five Asian economies feature among the top 15 – the Republic of Korea (5th) and Singapore (8th) are in the top 10, followed by China (12th), Japan (13th) and Hong Kong, China (14th).

4. Selected middle-income economies are changing the innovation landscape, starting with China, Turkey, Viet Nam, India and the Philippines are now pulling their weight

- China remains the only middle-income economy among the top 30 most innovative economies globally. Few other middle-income economies have managed to catch-up in innovation.
- Turkey (41st), Thailand (43rd), Viet Nam (44th), the Russia Federation (45th), India (46th), Ukraine (49th) and Montenegro (50th) make it into the GII top 50 this year.
- The TVIP economies alone (Turkey, Viet Nam, India and the Philippines) are systematically catching up. Beyond China, these four particularly large economies together have the potential to change the global innovation landscape for good.

5. Several developing economies are performing above expectation on innovation relative to their level of economic development

- India, Kenya, the Republic of Moldova, and Viet Nam hold the record for overperforming on innovation relative to their level of development for the 11th year in a row.
- Brazil, the Islamic Republic of Iran and Peru overperformed in 2021 for the first time ever.
- Sub-Saharan Africa is the region with the largest number of overperforming economies.

6. The geography of global innovation is changing unevenly

- Northern America and Europe continue to lead far in front of other regions for innovation.
- The innovation performance of South East Asia, East Asia, and Oceania (SEAO) has been the most dynamic in the past decade, and is the only region closing the gap.
- Northern Africa and Western Asia, Latin America and the Caribbean, Central and Southern Asia, and sub-Saharan Africa then follow in that order, albeit – despite strong performances by the Islamic Republic of Iran, Chile, the United Arab Emirates and South Africa – they remain stubbornly a long distance behind.
- In Latin America and the Caribbean, only Chile, Mexico, Costa Rica and Brazil rank among the top 60. Except for Mexico, few economies in this region have managed consistently to up their ranking over the past 10 years.
- In sub-Saharan Africa, only Mauritius and South Africa rank in the top 65; and only Kenya and the United Republic of Tanzania have remained firmly in the top 100 and improved their performance over time. Rwanda regained the lead position among low-income economies in this year's edition of the GII.

7. New science and technology (S&T) clusters are emerging, with the majority located in only a handful of countries

- Tokyo–Yokohama is the top performing S&T cluster once again, followed by Shenzhen–Hong Kong–Guangzhou, Beijing, Seoul and San Jose–San Francisco.
- The U.S. continues to host the highest number of clusters, followed by China, Germany, and Japan. Clusters in China recorded the largest increases in S&T output.
- Brazil, China, India, the Islamic Republic of Iran, Turkey, and the Russian Federation are all middle-income economies hosting top S&T clusters, with big growth seen in Delhi, Mumbai and Istanbul.

Global Innovation Tracker

What is the global state of innovation? Has the pandemic slowed or accelerated investments in innovation? How fast is the rate of technological progress? How do new technologies change the world?

This new segment of the GII provides a perspective on global innovation performance, drawing on a select set of indicators.

Science and innovation investments

		R&D expenditures			
		Total	Business	International patent filings	
Short term	Scientific publications 2019 → 2020	8.5% 2018 → 2019	7.2% 2018 → 2019	3.5% 2019 → 2020	Venture capital deals 2019 → 2020 5.8%
Long term	5.4% 2010 → 2020 (annual growth)	4.9% 2009 → 2019 (annual growth)	5.2% 2009 → 2019 (annual growth)	5.3% 2010 → 2020 (annual growth)	3.6% 2010 → 2020 (annual growth)

Technological progress

		Costs of renewable energy		
		Solar photovoltaic	Onshore wind	
Short term	Microchip transistor count 2018 → 2019	-13.1% 2018 → 2019	-9.2% 2018 → 2019	Drug approvals 2019 → 2020 10.4%
Long term	32.3% 2009 → 2019 (annual growth)	-6.9% 2010 → 2019 (annual growth)	-3.7% 2010 → 2019 (annual growth)	9.7% 2010 → 2020 (annual growth)

Socioeconomic impact

	Labor productivity	Life expectancy	Carbon dioxide emissions
Short term	4.0% 2019 → 2020	0.2% 2018 → 2020	0.06% 2018 → 2020
Long term	2.2% 2010 → 2020 (annual growth)	0.3% 2009 → 2019 (annual growth)	1.48% 2009 → 2019 (annual growth)

Notes: See the Data notes section below for a definition of indicators and their data sources. Long-term annual growth refers to the compound annual growth rate (CAGR) over the indicated period.

Monitoring the pulse of innovation is no easy task. Transforming an idea into a new good or service can take months, if not years. It takes even longer for technological advances to be widely adopted, create new jobs, enhance economic productivity and improve people's health and well-being. Today's progress is the result of past innovations; today's innovations, in turn, sow the seeds for progress in the years to come.

No single indicator captures the full spectrum of innovation performance from idea inception to impact. This is precisely why the GII relies on a wide set of indicators to measure the innovation performance of economies. Similarly, to capture key innovation trends, the Global Innovation Tracker looks at a variety of data points. It does so for three broad stages of the innovation journey: science and innovation investments; technological progress; and socioeconomic impact.

Science and innovation investments

The global pandemic has had a profound effect on economic activity. Global output declined by 3.3 percent in 2020, as containment measures to tackle the pandemic caused overall demand to decline and supply chains to fail (IMF, 2021). Financial market uncertainty soared. Historical experience would suggest that such adverse conditions would prompt a cutback in innovation investments. In many ways, however, this crisis differs from previous macroeconomic crises. Certain sectors – from personal protective equipment and consumer electronics to bicycles and home delivery services – actually experienced increased demand. Innovation, in turn, has been at the center of the fight to combat the pandemic and contain its impact.

The key indicators of global science and innovation investments – scientific publications, research and development (R&D) expenditures, international patent filings and venture capital deals – reflect this mixed impact of the pandemic.

Scientific publications

The pandemic has left no obvious mark on overall scientific output. The publication of scientific articles worldwide grew by 7.6 percent in 2020 – lower than the 2019 growth rate, but faster than the 10-year average growth rate (see Dashboard). The top five origins of scientific output – China, the United States, the United Kingdom, Germany and India – all saw lower growth in 2020 than in 2019, bearing in mind that the 2019 growth rates were exceptionally high.

The top five fields of scientific publishing in 2020 remained the same as in 2019: multidisciplinary materials science, environmental sciences, electrical and electronic engineering, multidisciplinary chemistry and applied physics.

Looking at the fastest growing scientific fields, some influence of the pandemic appears visible. Health and, in particular, the field of *public, environmental and occupational health* saw record growth in 2020 (19.1 percent, Figure 1). The latter field covers topics such as virus transmission and measures to prevent the spread of diseases, as well as the psychological distress resulting from the pandemic. That said, other non-pandemic related fields, such as cancer research, also contributed to the fast growth in health-related scientific output.

Overall, environmental topics continue to register fast growth in scientific output (see Figure 1). Environmental sciences grew by 21.2 percent in 2020, overtaking electrical and electronic engineering as the second most active publication field. Twenty years ago, less than 1.8 percent of scientific publications related to environmental sciences, compared to around 5.1 percent in 2020. Artificial intelligence stands out as another field showing strong growth in 2020.

Figure 1
Fastest growing significant research fields by
number of publications, 2020

Source: Web of Science (Clarivate) (WoS) articles published in the Social Sciences Citation Index (SSCI) and Science Citation Index Expanded (SCIE), restricted to science and technology fields and fields with more than 20,000 publications in 2020 (so all the fields in the top 30 percent). Fields represent the WoS categories [accessed on April 16, 2021].

Notes: CAGR values are computed using 2010 as the base year. If an article is published in more than one field (i.e., under more than one WoS category), then the article is counted once in each field. Hence, summing all fields would result in some double counting.

R&D expenditures

Over the past decades, investments in R&D have consistently grown faster than economic output. They reached an all-time high before the onset of the pandemic, growing at an exceptionally high rate of 8.5 percent in 2019 (see Dashboard). In comparison, global GDP grew by only 2.4 percent that year. With already high growth in R&D expenditures in 2017 and 2018, the pre-pandemic years have seen one of the most pronounced increases in the world economy's R&D intensity on record.¹

The top five R&D spending economies in 2019 were the United States (+10.9 percent), followed by China (+11.1 percent), Japan (−0.4 percent), Germany (+2.3 percent) and the Republic of Korea (+4.8 percent). These five economies have consistently been the world's major R&D spenders since 2011. Business R&D expenditure – the largest component of total global R&D – grew by 7.2 percent in 2019, up from 4.6 percent in 2018.

How did R&D expenditure fare in 2020, as the pandemic upended economies around the world? Unfortunately, 2020 data do not yet exist. Given the delays in R&D reporting, nationwide data documenting any pandemic effect will not be available until 2022. Historically, R&D expenditures have moved in parallel with GDP, slowing markedly during the economic downturns of the early 1990s, early 2000s and late 2000s (Figure 2). Revenue declines, cash flow shortages, cost-cutting measures, falling tax revenues and increased risk aversion are some of the key transmission channels through which falling output reduces R&D investments.

If the pandemic's impact were to mirror historical experience, 2020 R&D expenditure growth would be hard hit – possibly declining by as much as 2.8 percent.² However, there are reasons to be optimistic that R&D expenditures will have turned out to be more resilient over the course of the pandemic. The first reason for such optimism is the nature of the crisis itself: as pointed out above, the impact of the crisis has been highly uneven across industries and innovation was at the heart of the response to the pandemic. Second, the limited available R&D data points for 2020 do not suggest pronounced declines. In particular, government budget allocations for the top R&D spending economies that have already disclosed their R&D budgets continued to grow in 2020 (see Figure 3).³

Figure 2
R&D and GDP growth, 2001–2022

Sources: Authors' estimates based on the UNESCO Institute for Statistics database, OECD Main Science and Technology Indicators, Eurostat, and the IMF World Economic Outlook.

Figure 3
Government budget allocations for R&D, growth in 2020

Source: Joint OECD–Eurostat data collection on resources devoted to R&D.

On the corporate side, some information is available from companies' financial reporting. R&D investment data are available for 1,707 of the top 2,500 largest corporate R&D spenders worldwide. Overall, this sample of firms increased their R&D expenditures by around 10 percent in 2020, with 60 percent of companies reporting an increase.

Interesting patterns emerge across industries. In the pharmaceuticals and biotechnology industry, around 62 percent of companies reported an increase in R&D spending. This share rises to 65 percent within the ICT hardware and electrical equipment industry and to 80 percent within software and ICT. The industries with a majority of companies reporting R&D investment declines include the automobile as well as the travel, leisure and personal goods industries, with shares of 68 percent and 65 percent, respectively (see Figure 4).

These cross-industry patterns broadly correspond to the differential impact of the crisis. This is also borne out when looking at the R&D performance of individual companies. Generally, companies which stood to gain from pandemic-induced shifts in demand increased their R&D efforts. These include Alibaba, Netflix, Nintendo, Nvidia and many of the large pharmaceutical companies (see Figure 5). In contrast, those companies whose business models rely on in-person activities or travel decreased expenditures, including Trip.com, Airbus, Boeing, Uber, Lyft and most automobile manufacturers.

A fuller assessment of corporate R&D performance in light of the crisis will need to await the availability of more complete data, including data from small and medium-sized enterprises that may have experienced more curtailed access to finance in 2020. However, the data available so far indicate that 2020 R&D expenditures were more resilient in the face of the economic downturn than historical experience would suggest.

Figure 4
Share of firms reporting R&D expenditure increases, 2020

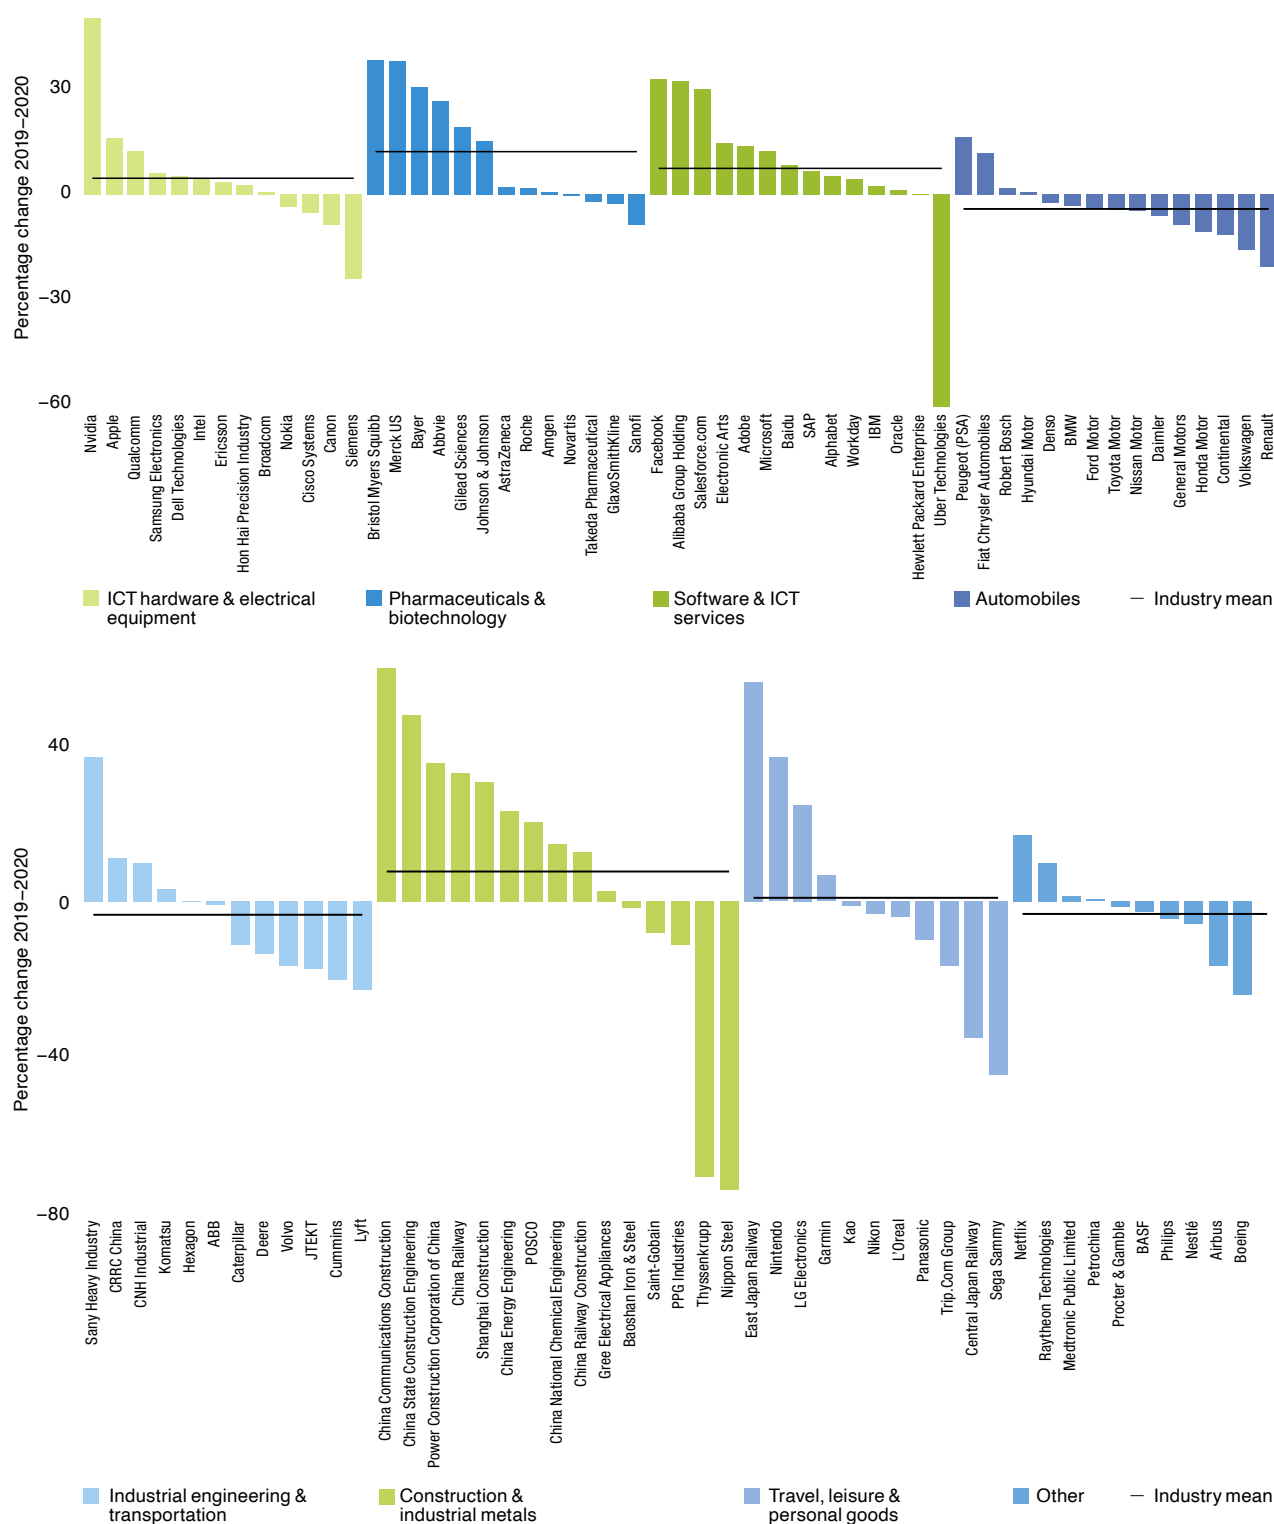

Source: Data sourced from the Bureau van Dijk Orbis database, where annual 2019 and 2020 data were utilized.

Note: Percentage changes were calculated as the difference between the 2020 and 2019 financial results over the 2019 results.

Figure 5

Corporate R&D expenditure, selected top R&D spenders worldwide, 2020 growth

Source: Data sourced from the Bureau van Dijk Orbis database, where the most recent eight-quarter period in local currency was utilized.

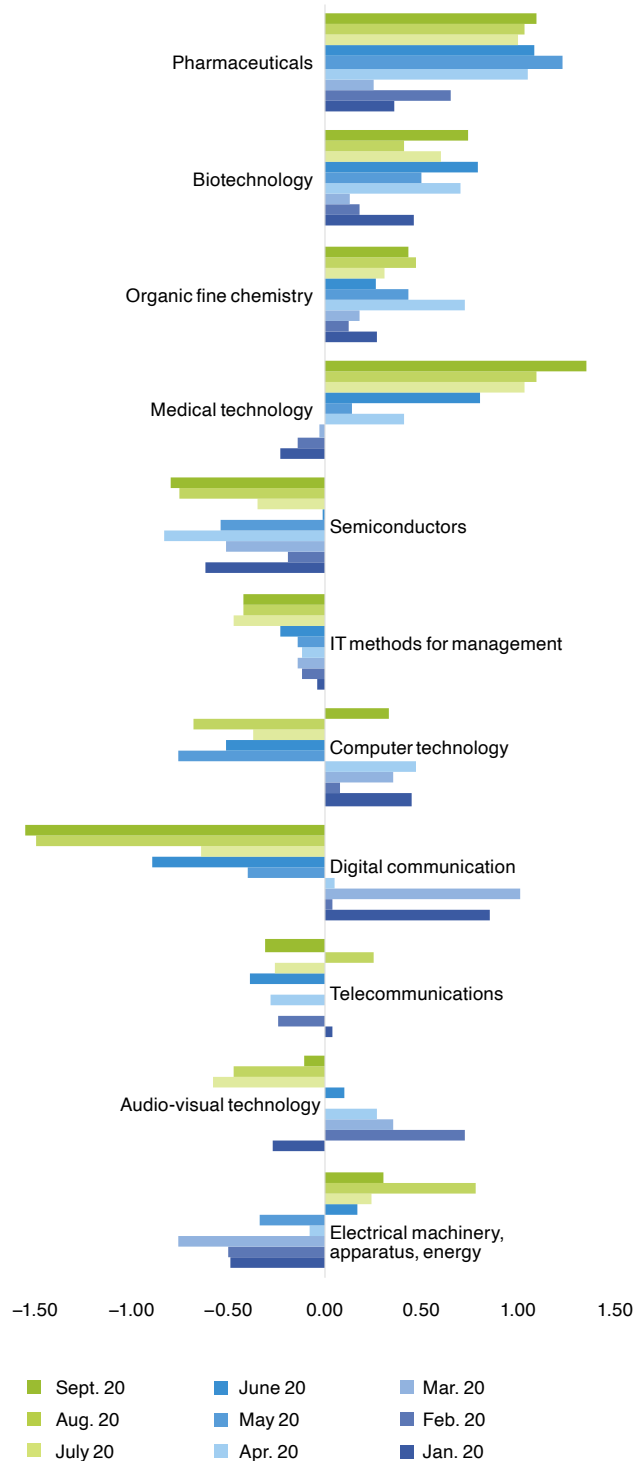

Note: Percentage changes were calculated as the difference between the most recent four-quarter period (t0) and the next most recent (t-1) over the next most recent (t-1). Thus, results in Figure 5 are not directly comparable to those from Figure 4.

International patent filings

Notwithstanding the decline in global output, international patent filings reached a new all-time high in 2020. They increased by 3.5 percent, fueled by particularly fast growth from China (16 percent). The Republic of Korea and the United States also saw solid growth, whereas Japan and most European economies registered declines.

The most dynamic technology fields in 2020 were medical technology, pharmaceuticals and biotechnology. This contrasts with previous years when digital communications, computer technology and audiovisual technology were the fastest growing fields. Most of the inventions underlying international patent filings in 2020 predate the pandemic. The strong patenting performance of health-related technologies does not, therefore, reflect an invention response to the crisis. Rather, it indicates that the pandemic has led innovators in the health-care sector to upgrade the commercial potential of their recent inventions.

Figure 6
Percentage point changes in share of PCT applications in 2020

Source: WIPO, 2021.

Note: The percentage point changes are relative to the corresponding months in 2019.

Figure 7

Number of VC deals by region, three-point moving average, 1997–2021 (top), and growth in VC deals, by region, 2019–2021 (bottom)

Source: Refinitiv, Eikon (private equity screener), accessed May 20, 2021.

Note: Africa and Latin America and the Caribbean are omitted from the growth charts because low numbers caused high volatility.

Venture capital deals

The number of venture capital (VC) deals grew by 5.8 percent in 2020, exceeding the indicator's 10-year average growth rate of 3.6 percent (see Dashboard). The exceptional resilience of innovation financing is even more remarkable considering the fact that VC deals declined in Europe and Northern America in the second quarter of 2020 when overall financial market uncertainty soared (see Figure 7). Strong growth in the Asia Pacific region more than compensated for this decline.

Aside from the rapid growth of VC deals in the Asia Pacific region (+26.6 percent), both Africa and Latin America and the Caribbean also registered double-digit increases (+82.7 percent and +12.1 percent, respectively) – albeit from significantly lower levels (see Figure 7). Northern America and Europe ended the year with declines of –3.1 percent and –0.7 percent, respectively.

First quarter figures for 2021 suggest even more vibrant VC activity this year, with the Asia Pacific region reaching an all-time high with 1,260 deals. In funding terms, first quarter 2021 VC activity in all regions already equates to nearly half of total funding in 2020, setting a strong pace for the rest of the year.

Technological progress

Technological progress usually occurs gradually over a number of years. The development of the COVID-19 vaccines has defied this pattern. They were developed, clinically tested and manufactured at unprecedented speed. As of July 2021 – within 16 months of the pandemic's onset – more than 3.5 billion people worldwide had already received at least one jab. Much remains to be done to achieve equitable access to vaccines worldwide but the achievements so far arguably rank among the most spectacular episodes of technological progress.

Fully tracking the speed of progress across all areas of technology is not possible. However, monitoring progress in a few important areas, such as those detailed below, does provide useful insights.

Microchip transistor count

One popular way of tracking progress in digital technologies is to count the number of transistors on cutting-edge microchips. Moore's law famously holds that this number doubles every two years – a prediction that has proved roughly true since the 1970s. The transistor counts for the latest microchips commercialized in 2019 – AMD's Epyc and IBM's Power9 – continue to follow Moore's exponential growth path. They contain more than twice the number of transistors of the cutting-edge 2017 models. Since 2009, microchip capacity has increased by more than 30 percent per year.

Costs of renewable energy

Technological progress has prompted dramatic falls in the cost of renewable energy. Between 2010 and 2019, the cost of solar photovoltaic energy declined by 6.9 percent per year and that of onshore wind energy by 3.7 percent per year. The 2018–2019 trends show even faster declines in cost of 13.1 percent and 9.2 percent, respectively. Importantly, in most places, power from renewable energy sources is now cheaper than power from fossil fuels. This marks a significant milestone in the drive toward cheaper energy that supports the achievement of CO₂ reduction targets.

Drug approvals

Beyond the COVID-19 vaccines, there is broader progress in finding treatments for various diseases. After experiencing a decline in the 2000s, the number of new drug approvals has been trending upward. It has grown by 9.7 percent over the past 10 years. The latest 2020 data are in line with this trend. These figures only concern the U.S. economy, which spends the most on pharmaceutical R&D. In addition, the health impact of newly approved drugs varies. Nonetheless, the upward trend in drug approval mirrors broader optimism about advances in the biosciences to further improve human health (*The Economist*, 2021). One example is the recent publication of promising clinical trial results for a vaccine against malaria, following many years of failed efforts (Dattoo *et al.*, 2021).

Socioeconomic impact

What impact does innovation have on people's daily lives? Historically, technological progress has been a key force behind sustaining economic growth, improving living standards and offering better health outcomes. Even though innovation's track record on the environment is mixed, new technologies have also contributed to lowering pollution levels and promoting greater sustainability.

What do the latest data tell us about the socioeconomic impact of innovation?

Labor productivity

The impact of the pandemic on labor productivity has been mixed. Output per hour worked jumped by 4 percent in 2020. This increase mainly reflects the curtailment of economic activities with low productivity, often as a direct result of the containment measures introduced to tackle the pandemic. By contrast, output per worker actually decreased by 0.9 percent, as companies retained their workforce on furlough schemes, often with government support (The Conference Board, 2021).

Between 2010 and 2020, labor productivity grew by 2.2 percent per year – a slower pace compared to previous decades. Other measures of productivity – notably, total factor productivity – show similar long-term declines, especially in developed economies (Moss *et al.*, 2020). This has prompted economists to ask whether the ability of technological innovation to raise productivity and foster long-term economic growth has diminished. While this remains an open question, other factors besides technological progress may explain slower productivity growth – notably, demographic change, a growing share of services in economic output and stagnating levels of educational attainment. In addition, productivity trends could well change, as economies adopt the latest technologies.

Life expectancy

Life expectancy in the world stood at 72.7 years in 2019, up from 70.2 years in 2009 and 52.6 years in 1960. Technology has been a key contributor to longer life spans. Scientific advances have promoted healthier lifestyles; medical and pharmaceutical innovations have led to more effective treatments against a wide range of diseases.

Worldwide life expectancy data for 2020 are not yet available. In the United States, preliminary data for 2020 suggest that excess mortality due to COVID-19 has caused life expectancy to fall by one whole year (Arias *et al.*, 2021). Similar declines have been reported for the United Kingdom (Public Health England, 2021). It is important to note that these declines do not mean that a newborn baby can expect to have fewer years of life. They mainly capture the current – and hopefully temporary – increase in mortality rates.

Carbon dioxide emissions

Steps to limit global warming rely on the reduction of greenhouse gas emissions. Global carbon dioxide (CO₂) emissions – accounting for more than half of all greenhouse gases – continued to increase up to 2019. For 2020, CO₂ emissions are projected to fall, as the COVID-19 pandemic slowed the social and economic activities that are responsible for such emissions.⁴ As those activities have started to rebound in 2021, CO₂ emissions are set to rise again. Technological progress – particularly the falling costs of renewable energy (see above) – has already enabled the reduction of CO₂ and other greenhouse gases. Future innovation is bound to expand this potential. At the same time, harnessing the potential of technology requires coordinated policies and long-term investments.

Conclusion

The GII Global Innovation Tracker provides a data-driven perspective on the latest innovation trends. It offers the following insights:

- Overall, investments in science and innovation have been remarkably resilient in the face of the greatest economic downturn for decades. Scientific output, R&D expenditures, international patent filings and venture capital deals continued to grow in 2020, building on already strong pre-crisis performance.
- Nonetheless, the global pandemic has left its mark on the global innovation landscape. Sectors which saw collapsing demand – such as transport and travel – had to cut back their innovation outlays. By contrast, companies whose innovations were at the center of measures to contain the pandemic and its fallout – notably, pharmaceuticals and ICTs – redoubled their investments in innovation.
- The pandemic has accelerated the long-term geographical shift of innovation activities toward Asia, even if Northern America and Europe continue to host some of the world's leading innovators.
- Technological progress at the frontier holds substantial promise. The rapid development of COVID-19 vaccines powerfully demonstrates this promise. There is also continued progress in other technology fields – such as ICTs and renewable energy – that has the potential to raise standards of living, improve human health and protect the environment.

Notes

- 1 This result mirrors findings for industrialized countries covered by the Organisation for Economic Co-operation and Development (OECD). See the latest data, published on March 18, 2021, in the OECD Main Science and Technology Indicators (MSTI) database, https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB. For a more in-depth analysis of COVID-19 and innovation, see Paunov and Planes-Satorra (2021).
- 2 The estimate of a 2.8 percent decline is based on the assumption that R&D to GDP ratios at the country level stay the same as in 2019, so that the 2020 GDP decline is passed on to R&D expenditures in full.
- 3 Government R&D budget indicators for the OECD area present the amounts that governments agree to allocate to R&D as part of their budgetary processes, rather than actual expenditure reported by R&D performers.
- 4 For further details, see the Carbon Monitor, <https://carbonmonitor.org>.

Data notes

Scientific publications captures the number of peer-reviewed articles published in the Social Sciences Citation Index (SSCI) and Science Citation Index Expanded (SCIE). Source: Web of Science (Clarivate), <https://apps.webofknowledge.com>.

R&D expenditures captures R&D expenditures worldwide in PPP-adjusted constant 2015 prices. The 2019 values were calculated using available real data of gross expenditure on R&D (GERD) and business enterprise expenditure on R&D (BERD) at the country level from the UNESCO Institute for Statistics (UIS) online database, the OECD's Main Science and Technology Indicators (MSTI) database (March 2021 update) and Eurostat. For those countries for which data were not available for 2019, the 2019 data were estimated using the last observation carried forward (LOCF) method.

International patent filings refers to the total number of patent applications filed through the WIPO-administered Patent Cooperation Treaty. Source: WIPO IP Statistics Data Center, <https://www3.wipo.int/ipstats>.

GII 2021 results

The GI helps create an environment that evaluates innovation factors continuously.

In 2021, it provides detailed innovation metrics for 132 economies.

The following sections present the results of the GII 2021. Appendix I provides details on how to interpret and analyze the results, in particular regarding year-on-year comparison of the GII ranks, which requires cautious interpretation.¹

The GII 2021 innovation leaders

Only a few economies have consistently delivered peak innovation performance.

Only Switzerland and Sweden have remained in the top three of the innovation ranking for more than a decade. Switzerland, Sweden, the United States of America and the United Kingdom have ranked in the top five for the past three years, while the Republic of Korea joins the top five of the GII for the first time in 2021 (Figure 8).

The top 25 of the most innovative economies are mainly from Europe, with France (11th) and Estonia (21st) making notable progress. Five Asian economies shine in the top 15 – the Republic of Korea (5th) and Singapore (8th) in the top 10, with China (12th), Japan (13th) and Hong Kong, China (14th) following. Singapore has been among the top 10 most innovative economies consistently for the past 14 years.

China is still the only middle-income economy to make it into the top 30. China reaches the top three in the South East Asia, East Asia, and Oceania (SEAO) region for the first time and remains top of the upper middle-income group (Figure 9).

Bulgaria (35th) and Malaysia (36th) are the only other middle-income economies close to the top 30 of the GII (see Table 5), but with no consistent increase in rank over time. Indeed, Malaysia has been hovering close to the top 30 for the past 11 years but has not yet reached the mark.

Japan ranks 13th, up from 16th in 2020. The United Arab Emirates (UAE) (33rd) remains in the top 35 this year and moves up one place. The UAE has been moving up the rankings since 2018, when it ranked 38th. Turkey (41st) makes a big jump into the top 50 and Brazil (57th) moves closer.

Since 2013, China has moved up the GII ranks consistently and steadily, establishing itself as a global innovation leader and getting closer to the top 10 every year. The performance of China is at the frontier of achievement, notably in innovation outputs. For instance,

China's levels of patents by origin, scaled by GDP, are higher than those of Japan, Germany and the United States, and are even more impressive when considered in absolute terms. The same is true with regard to the levels of Trademarks and Industrial designs by origin as a percentage of GDP. However, China is still behind, relative to Germany and the United States, in Human capital and research and in indicators such as Researchers (45th) and Tertiary enrolment (57th). China also trails the United States in Market sophistication and Business sophistication, and is even further behind in Institutions (61st).

The Republic of Korea (5th) made notable advances in the Innovation Output Sub-Index (5th) and, in particular, in the indicators Trademarks by origin (8th), Global brand value (5th) and Cultural and creative services exports (40th). It also ranks 3rd worldwide in the new GII output indicator Production and export complexity. In terms of innovation inputs, the Republic of Korea moved up the rankings in two pillars: Institutions (28th) and Infrastructure (12th). It also comes top in the sub-pillar ICTs (1st) and, notably, in Government's online service and E-participation.

A changing global innovation landscape

Selected middle-income economies are changing the innovation landscape, starting with China, Turkey, Viet Nam, India and the Philippines are now pulling their weight.

It is challenging for emerging economies to consistently improve their innovation performance and systems to match high-income, more prosperous economies. Only a limited number of middle-income economies have managed to catch up in innovation, by complementing successful domestic innovation with international technology transfer.

In addition to China, Bulgaria and Malaysia, which lead the middle-income group rankings, only Turkey (41st), Thailand (43rd), Viet Nam (44th), the Russian Federation (45th), India (46th), Ukraine (49th) and Montenegro (50th) make it into the top 50.

However, besides China, only the TVIPs (Turkey, Viet Nam, India and the Philippines) are systematically catching up. All four Asian economies have romped up the ranks by an average of 22 positions in the past decade: Turkey from

☆ indicates a new entrant into the top three in 2021.

[†] Top three in Northern Africa and Western Asia (NAWA) – excluding island economies. The top four in the region, including all economies, are as follows: Israel (1st), Cyprus (2nd), United Arab Emirates (3rd) and Turkey (4th).

^{*} Top three in sub-Saharan Africa (SSA) – excluding island economies. The top five in the region comprise Mauritius (1st), South Africa (2nd), Kenya (3rd), Cabo Verde (4th) and the United Republic of Tanzania (5th).

Source: Global Innovation Index Database, WIPO, 2021.

Notes: World Bank Income Group Classification (June 2020). Year-on-year GII rank changes are influenced by performance and methodological considerations; some economy data are incomplete (see Appendix I).

65th in 2011 to 41st in 2021; Viet Nam from 76th in 2012 to 44th this year; India from 62nd to 46th; and the Philippines from 91st to 51st. It is noteworthy that these are particularly large economies, which have the potential to radically change the global innovation landscape for good.

Turkey makes it into the top 50, gaining 10 ranks this year to reach the 41st position. Viet Nam is overtaken by Thailand, as it declines by two ranks, from 42nd to 44th. This is nevertheless a considerable improvement on its average rank of 68th during the period 2013–2015. Viet Nam continues to lead the lower middle-income group (Table 1).

India (46th) moves further ahead, by two spots (48th in GII 2020), after making it into the top 50 last year. It takes 2nd place in the lower middle-income group. India held the 3rd position in its income group in 2019 and 2020 having entered the top three in 2019. India has also been portrayed as successful in developing sophisticated services that are technologically dynamic and can be traded internationally (Aghion *et al.*, 2021). It continues to lead the world in the ICT services exports indicator (1st)

and holds top ranks in other indicators, such as Domestic industry diversification (12th) and Graduates in science and engineering (12th).

Aside from the TVIPs, there are other economies that move up the rankings this year. Among the most notable movers are the Islamic Republic of Iran (60th), Oman (76th), Uzbekistan (86th), Paraguay (88th), Cabo Verde (89th) and Sri Lanka (95th).

Outside the top 100, Guatemala (101st), Tajikistan (103rd), Madagascar (110th) and Zimbabwe (113th) have made the most progress through the ranks, improving by between five and seven positions overall.

Rwanda (102nd) regains the 1st position in the low-income group after being 2nd in 2020. It ranked 1st in 2019, 2016 and 2015 and has been consistently in the top three of its income group since 2014.

Tajikistan (103rd) and Malawi (107th) make it into the top three in the low-income economies group (see Table 1).

Table 1
10 best-ranked economies by income group

Rank	Global Innovation Index 2021
High-income economies (51 in total)	
1	Switzerland (1)
2	Sweden (2)
3	United States (3)
4	United Kingdom (4)
5	Republic of Korea (5)
6	Netherlands (6)
7	Finland (7)
8	Singapore (8)
9	Denmark (9)
10	Germany (10)
Lower middle-income economies (34 in total)	
1	Viet Nam (44)
2	India (46)
3	Ukraine (49)
4	Philippines (51)
5	Mongolia (58)
6	Republic of Moldova (64)
7	Tunisia (71)
8	Morocco (77)
9	Kenya (85)
10	Uzbekistan (86)

Rank	Global Innovation Index 2021
Upper middle-income economies (34 in total)	
1	China (12)
2	Bulgaria (35)
3	Malaysia (36)
4	Turkey (41)
5	Thailand (43)
6	Russian Federation (45)
7	Montenegro (50)
8	Serbia (54)
9	Mexico (55)
10	Costa Rica (56)
Low-income economies (13 in total)	
1	Rwanda (102)
2	Tajikistan (103)
3	Malawi (107)
4	Madagascar (110)
5	Burkina Faso (115)
6	Uganda (119)
7	Mozambique (122)
8	Mali (124)
9	Togo (125)
10	Ethiopia (126)

Note: The overall Global Innovation Index rank is reported in brackets next to the economy.

Innovation overperformers

Several developing economies are performing above expectation on innovation relative to their level of economic development.

For several years, the GII has demonstrated the positive relationship between innovation and economic development: the more developed an economy is, the more it innovates, and vice versa (Figure 10). However, some economies break out of this pattern. Some perform above or below expectations, relative to their predicted performance and level of development.

In the GII 2021, 19 economies are performing above expectations relative to their level of development – termed innovation achievers (Table 2).

India, Kenya, the Republic of Moldova and Viet Nam are still record holders for being innovation achievers for 11 consecutive years. India's innovation performance is above the average for the upper middle-income group in five of the seven innovation pillars (it scores below average in the pillars of Infrastructure and Creative outputs). Kenya keeps its 3rd place in sub-Saharan Africa and scores above its income group in Institutions, Market and Business sophistication and Knowledge and technology outputs. It also scores above the average for its region in Human capital and research and Creative outputs. Viet Nam continues to score above the lower middle-income group average in all pillars and scores even above the average of the upper middle-income group in Market and Business sophistication, as well as in both output pillars.

However, there is change too this year. Brazil (57th), the Islamic Republic of Iran (60th) and Peru (70th) are innovation achievers in 2021 for the first time ever. In the case of Brazil, this distinction coincides with an upward move in the rankings to gain the 57th place.

Sub-Saharan Africa is the region with the highest number of economies performing above expectations (six in total). South East Asia, East Asia, and Oceania is 2nd (with four economies), Europe is 3rd (three economies), and Northern Africa and Western Asia, Latin America and the Caribbean, and Central and Southern Asia tie in 4th place (with two innovation achievers each).²

Conversely, 31 economies are performing below expectations on innovation. In the high-income group, three are European Union economies – Greece, Lithuania and Romania. In the upper middle-income group, there are two Latin American and Caribbean economies – Argentina and the Dominican Republic. In the lower middle-income group, 11 economies are performing below

expectations for their level of development, notably five from sub-Saharan Africa – Angola, Benin, Côte d'Ivoire, Cameroon and Nigeria.³

Relative to 2020, 30 economies changed performance groups. Fifteen economies changed their performance status from below expectations to matching expectations. The majority of these cases (six economies) are from Latin America and the Caribbean – the Plurinational State of Bolivia, Chile, Ecuador, Guatemala, Paraguay and Uruguay.

The persistent regional innovation divide

The geography of innovation is changing unevenly. South East Asia, East Asia, and Oceania is closing the global innovation divide with Northern America and Europe.

Despite some innovation “catch-up,” divides still exist with respect to national innovation performance in the world regions. This year, there are no changes in terms of which world regions perform best in innovation. Northern America and Europe continue to lead, followed by South East Asia, East Asia, and Oceania (SEAO), and, more distantly, by Northern Africa and Western Asia, Latin America and the Caribbean, Central and Southern Asia, and sub-Saharan Africa, respectively.

Northern America

Northern America, composed of the United States and Canada, is the most innovative world region. The United States keeps its 3rd place in the GII ranking, and Canada goes up one spot to reach the 16th place. The region is the highest performer in all GII pillars compared to all other world regions. The United States performs best in Business sophistication (2nd) and Knowledge and technology outputs (3rd), while Canada comes top in Market sophistication (1st) and fifth in Institutions.

Europe

Europe is still the second most innovative region in the world. It hosts a large number of innovative economies: 16 European economies are innovation leaders (i.e., in the top 25). A total of 10 economies move up the ranks this year: France (11th), Iceland (17th), Austria (18th), Estonia (21st), Hungary (34th), Bulgaria (35th), Slovakia (37th), Lithuania (39th), the Russian Federation (45th) and Belarus (62nd).

Source: Global Innovation Index Database, WIPO, 2021.

Notes: Income group classification follows the World Bank Income Group Classification (June, 2020). Geographic regions correspond to the United Nations publication on standard country or area codes for statistical use (M49).

On average, Europe is the second best performer worldwide, behind Northern America, in all GII pillars, except for Market sophistication, where it is also behind the average of the SEAO region. Finland has the most highly performing Institutions in the region (2nd worldwide). Sweden leads in Human capital and research (2nd) and Business sophistication (1st), Norway comes top in Infrastructure worldwide (1st), while the United Kingdom leads in Market sophistication (4th). Switzerland is the regional leader in innovation outputs: it ranks 1st worldwide in Knowledge and technology outputs and 2nd in Creative outputs.

South East Asia, East Asia, and Oceania (SEAO)

The innovation performance of the SEAO region has been the most dynamic in the past decade, closing the gap with Northern America and Europe. Five SEAO economies are world innovation leaders: the Republic of Korea (5th), Singapore (8th), China (12th), Japan (13th), and Hong Kong, China (14th). Among these leaders, China, the Republic of Korea and Japan have made the greatest advances up the rankings in the past 10 years (see Table 3).

Thailand (43rd), Viet Nam (44th), the Philippines (51st) and Indonesia (87th) have moved up between 5 and 40 GII ranks over the past decade. Thailand and Viet Nam rank among the top 30 worldwide in Market sophistication, as does the Philippines in Knowledge and technology outputs. They are now leaders in key innovation indicators, too. For instance, Thailand ranks 1st in R&D financed by business; and Viet Nam and the Philippines are world leaders in High-tech exports.

Northern Africa and Western Asia

In Northern Africa and Western Asia, the United Arab Emirates (UAE) remains in the top 35 and moves up to achieve the 33rd rank. Turkey makes a big jump into the top 50, reaching the 41st spot. An additional eight economies in the region move up the ranks, including Egypt (94th) and Algeria (120th).

Cyprus is the regional leader in Institutions (26th) and Creative outputs (20th), while Israel leads in Knowledge and technology outputs (6th), Market sophistication (8th), Business sophistication (8th) and Human capital and research (19th). The UAE tops the region in Infrastructure (14th).

The United States leads in several key innovation indicators. Hong Kong (China), Israel and Singapore follow

The economies at the top of the rankings are world leaders in key innovation indicators. This year, the United States is the absolute leader in this regard; holding first place in 13 indicators out of the 81 used, including metrics such as Global corporate R&D investors, venture capital deals received, the quality of its universities, the quality and impact of its scientific publications (H-index), the number of patents by origin and E-participation.

Hong Kong, China follows the United States in 2nd place, with world-topping performances in indicators such as New businesses, High-tech imports and Global brand value. Israel and Singapore tie in 3rd place, attaining the top rank in R&D expenditures and Regulatory quality, respectively. They are followed by China and the Republic of Korea in joint 5th place, leading on High-tech exports and Researchers, among other indicators. Luxembourg comes 7th with the top performance in Knowledge-intensive employment; and Switzerland and Japan are equal 8th, leading in Patent families, and Production and export complexity.

Economies with the most top-ranked GII indicators, 2021

Economy	Innovation indicators in which economies score best worldwide		
	Inputs	Outputs	Total
United States of America	 6	 7	 13
Hong Kong, China	 7	 4	 11
Israel	 6	 4	 10
Singapore	 6	 4	 10
China	 3	 6	 9
Republic of Korea	 5	 4	 9
Luxembourg	 6	 2	 8
Switzerland	 2	 4	 6
Japan	 2	 4	 6

Latin America and the Caribbean

In Latin America and the Caribbean, no economy makes it into the top 50. Chile (53rd), Mexico (55th), Costa Rica (56th) and Brazil (57th) are the only economies in the region in the top 60 (see Table 4). Moreover, with the exception of Mexico, these Latin American innovation pockets have not improved their rankings consistently over the past 10 years. However, Brazil makes a strong advance this year, improving by five positions and achieving its best rank since 2012.

Chile has the most balanced innovation system, ranking highest in the region in Institutions (40th) and Infrastructure (47th) (Table 5). Conversely, and relative to their performance in all GII pillars, Mexico is still behind in Institutions (77th) and Infrastructure (67th), while Costa Rica and Brazil are lagging in Infrastructure and Market sophistication. Brazil is the only economy in the region for which expenditures on R&D are above 1 percent of GDP and comparable to some European economies, such as Croatia and Luxembourg. Brazil also ranks highest in the region in the indicator Global corporate R&D investors (26th), above Mexico (31st) and Argentina (36th).

In the top 80, Uruguay (65th), Colombia (67th), Peru (70th) and Argentina (73rd) all moved up the ranks in 2021. Over the past 10 years, Colombia and Peru have improved their rankings, but not at a steady pace and with some difficulty.

Colombia still has a relatively unbalanced innovation system, performing less well in Human capital and research (78th) and in the innovation outputs pillars, in contrast to its relatively good performance in Market sophistication (42nd) and Business sophistication (50th). Peru achieves its best ranking this year in Market and Business sophistication (38th and 37th, respectively), but still struggles to translate its innovation inputs into outputs. It is also an innovation achiever for the first time this year, highlighting its potential for further improvements in the future (see Table 2).

Central and Southern Asia

In Central and Southern Asia, India leads in 46th position, having consistently risen up the ranks since 2015, when it ranked 81st. The Islamic Republic of Iran is 2nd in the region, going up to 60th place. Kazakhstan ranks 3rd at the 79th position (see Table 3). Uzbekistan continues to move upward, by seven places, and achieves the 86th rank in 2021. The innovation performance of Kazakhstan (79th) and Tajikistan (103rd) improved in 2021 but has been less steady over the past years.

■ 1st quartile (ranks 100th to 132nd)

Source: Global Innovation Index Database, WIPO, 2021.

Overall, the region performs best in Market sophistication. In terms of innovation inputs, Kazakhstan leads the region in Institutions (45th rank overall) and Infrastructure (58th), the Islamic Republic of Iran leads in Human capital and research (49th), Uzbekistan in Market sophistication (24th) and India in Business sophistication (52nd). India is also at the top of the region in the Knowledge and technology outputs pillar (29th), while the Islamic Republic of Iran comes top in Creative outputs (46th).

Sub-Saharan Africa

In sub-Saharan Africa, only Mauritius (52nd) and South Africa (61st) rank in the top 65; and only Kenya (85th) and the United Republic of Tanzania (90th) have remained firmly within the top 100 and have improved their performance over the past five years. No economy has steadily improved its rankings over time. A total of 10 economies in the region move up the GII ranks this year, including Kenya (85th), Namibia (100th), Malawi (107th), Madagascar (110th), Zimbabwe (113th) and Burkina Faso (115th). Cabo Verde reaches 89th place this year, a considerable increase from its position at 103rd place in 2013.

On average, the region performs best in Institutions, even ranking above the average of the Central and Southern Asia region. Mauritius ranks highest in the region in Institutions (21st), Infrastructure (65th) and Creative outputs (31st). Namibia comes top in Human capital and research (57th), and South Africa in Market sophistication (23rd), Business sophistication (51st) and Knowledge and technology outputs (61st).

Creating balanced and efficient innovation ecosystems

Innovation leaders have balanced and high-performing innovation systems. However, efficiency in translating innovation inputs into outputs is still eluding several high-income economies

Innovation leaders and the economies that have consistently advanced up the GII ranks over the past decade have dynamic innovation systems and combine efficiency in translating innovation inputs into outputs with a balanced and strong performance across all GII pillars.

Translating an economy's investments in innovation – in the form of R&D, education, and solid infrastructure and institutions supporting innovative activities – into innovation outputs is not an easy feat.

Some economies excel in efficiently converting innovation inputs into outputs. Among the high-income group economies, Switzerland (1st) produces considerably higher levels of outputs than other high-income economies, such as Sweden (2nd), the United States (3rd) and Singapore (8th), at comparable levels of innovation inputs (Figure 11). The Czech Republic (24th) produces the same levels of outputs as Japan (13th) or Singapore (8th) at much lower levels of innovation inputs.

Among the upper middle-income group economies, China (12th) ranks 7th overall in the Innovation Output Sub-Index, and its levels of outputs are comparable to those of high-income economies like the United Kingdom (4th), the Netherlands (6th) and Germany (10th), even though its overall level of innovation inputs is lower. Bulgaria (35th) has outputs comparable to high-income economies, such as Norway (20th) and Italy (29th), with fewer inputs.

The United Republic of Tanzania (90th), among the lower middle-income group economies, performs on innovation outputs at levels comparable to high-income Latin American economies Chile (53rd) and Uruguay (65th). In addition, Viet Nam (44th) and the Philippines (51st) do the same, relative to other high-income European Union economies, such as Latvia (38th), Lithuania (39th) and Poland (40th), with a lower level of innovation inputs.

Low-income sub-Saharan Africa economies Malawi (107th), Madagascar (110th), Ethiopia (126th) and Guinea (130th) are also efficiently transforming their limited innovation inputs and resources into innovation outputs.

However, there are also several high-income economies that struggle to obtain a better balance between their level of investments and their level of innovation results, to the detriment of their overall innovation performance and GII ranking. This group includes, notably, oil and natural gas producers and exporters Canada (16th), Norway (20th), the United Arab Emirates (UAE) (33rd), Bahrain (78th) and Brunei Darussalam (82nd). All these economies rank considerably lower in the Innovation Output Sub-Index, relative to their ranking in the Innovation Input Sub-Index. For instance, the UAE ranks 23rd in innovation inputs overall, and 47th in outputs. The economy's ranking in innovation outputs has, however, improved this year relative to 2020, moving in the right direction to achieve greater balance in the innovation system.

Peru (70th), despite being an innovation achiever, it is also struggling to effectively utilize its innovation inputs (ranked 52nd in the Innovation Input Sub-Index) into innovation results (82nd) and more effort is needed to achieve a better balance in the innovation system.

Figure 11
Innovation input to output performance, 2021

Moreover, innovation leaders have complementarity and balance across the different areas of their innovation system. A successful innovation system balances knowledge creation, exploration and investments – the innovation inputs – with the production of ideas and technologies toward application, exploitation and impact – the innovation outputs.

A balanced and strong performance across all seven pillars is most clearly evident among the innovation leaders (top 25). Only 15 economies – including Switzerland, Sweden, the United States, Singapore and France, or 11 percent of all economies ranked this year, have strong performances across all seven GII pillars (Table 5).

However, certain economies that are ranked lower overall in the GII are also leaders in specific areas. Examples include Turkey, highly ranked in Human capital and research (26th); Thailand, Viet Nam and Uzbekistan, with their relatively high ranking in Market sophistication (27th, 22nd and 24th, respectively); and Mongolia, ranked in the top 30 in Creative outputs (28th). These discrepancies in performance within economies also hint at innovation systems that are changing and dynamic with the potential for increased overall performance in the future.

The GII top science and technology clusters

New science and technology (S&T) clusters are emerging. Clusters in China made the most consistent rank improvements. Delhi, Mumbai and Istanbul also advanced strongly this year.

Divides also exist in the ranking of the global science and technology (S&T) clusters. The top 100 S&T clusters are hosted by 26 economies, of which six – Brazil, China, India, the Islamic Republic of Iran, Turkey and the Russian Federation – are middle-income economies (Table 6).

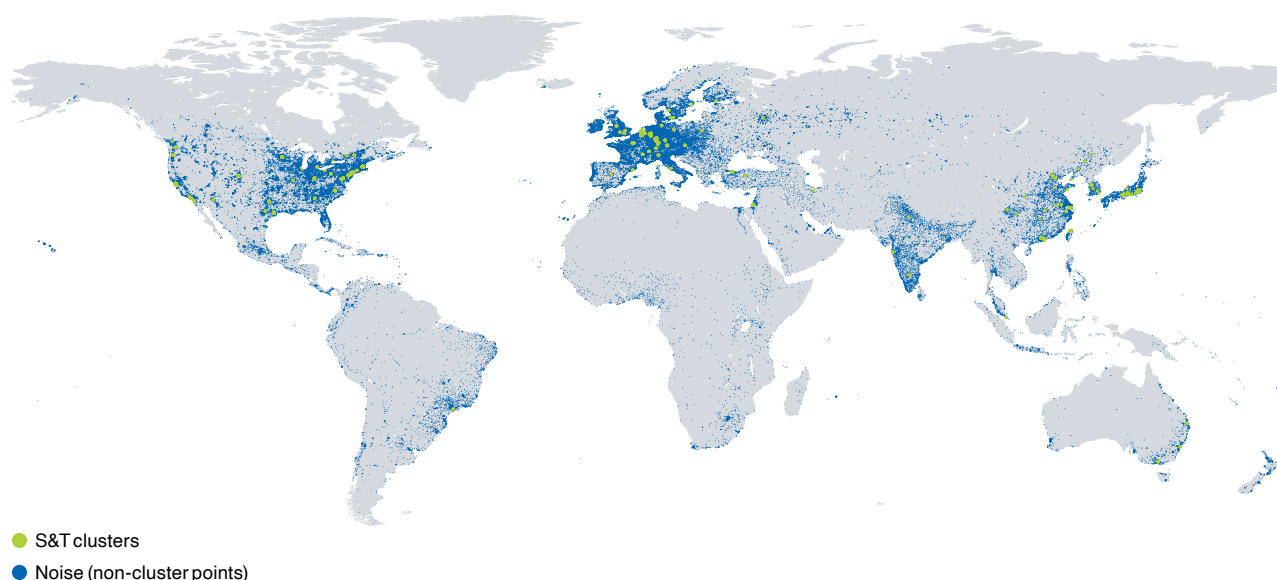

Tokyo-Yokohama is the top-performing cluster again, followed by Shenzhen–Hong Kong–Guangzhou, Beijing, Seoul and San Jose–San Francisco (see Annex Table 3, Top 100 clusters). The top 10 clusters remain the same as last year with only minor shifts. Beijing overtook Seoul to occupy the 3rd spot, and Shanghai switched with New York City, NY in 8th position. The largest increases in rank came from three Chinese clusters – Qingdao (+16 positions), Shenyang (+14) and Dalian (+13). Shenyang and Dalian, along with the Korean cluster Daegu, make up the three new entrants into this year's top 100 clusters (Map 1).

The United States continues to host the largest number of clusters (24), followed by China (19), Germany (9) and

Japan (5). Chinese clusters experienced the largest increases in S&T output, with the median increase equating to +14.4 percent, and China hosts the fastest growing clusters with Qingdao (+33.1 percent) and Suzhou (+21.7 percent).⁴ Other middle-income clusters besides China also experienced strong growth, including Delhi (+6.6 percent), Mumbai (+6.3 percent) and Istanbul (+5.5 percent). High-income economy clusters grew at a slower pace than clusters in middle-income economies. A decline within clusters in the United States accounted for most of this slower growth. There were some notable exceptions, namely Kanazawa (+12.1 percent) in Japan, Daejeon (+9.0 percent) in the Republic of Korea and Melbourne (+7.8 percent) in Australia.

Many European and U.S. clusters show more intense S&T activity than their Asian counterparts do. The United States has nine clusters in the top 25 by S&T intensity, followed by Germany and Sweden (with three each). Cambridge in the United Kingdom and Eindhoven in the Netherlands/Belgium, emerge as the most S&T-intensive clusters. Ann Arbor, Michigan (United States), Oxford (United Kingdom) and San Jose–San Francisco, CA (United States) follow (see Annex Table 4, Ranking of S&T intensity, 2015–2019). As was the case in the previous year's ranking, S&T intensity was higher if patenting activity drove a cluster's output, with 15 out of the top 25 clusters deriving the majority of their output from patents.

Note: Noise refers to all inventor/author locations not classified as being in a cluster.

Conclusion

In conclusion, the GII continues to support and foster innovation through changing times. The aim of the GII is to provide insightful data on innovation and, in turn, to assist policymakers in evaluating their innovation performance and making informed innovation policy decisions. The 2021 edition of the GII – with its informed conclusions on innovation developments both generally and in the context of the COVID-19 pandemic – makes a significant contribution to this end.

Two key insights emerge from this year's report.

- The global innovation landscape is changing too slowly. The GII has been warning of this for several years now, as high-income economies, notably from Northern America and Europe, continue to lead the GII ranks and have the strongest and most balanced innovation systems. There is an urgent need for this to change, particularly in the context of the COVID-19 crisis. Confronted with an unprecedented crisis, it is important to fully leverage the power of innovation to collectively build a cohesive, dynamic and sustainable recovery. The short-term and longer term impacts of the pandemic on science and innovation systems have to be monitored and findings acted up on.
- There are a few middle-income economies, notably the TVIPs, that are catching up with the leaders. However, the pandemic's effects on R&D investment – the uneven reduction of R&D expenditures in some sectors and the fact that governments have not made innovation and R&D a priority in current stimulus packages – will hamper convergence. It is therefore crucial that support for innovation becomes broader and that it is conducted in a countercyclical way (i.e., as business innovation expenditures slump, governments strive to counteract that effect with their own expenditure boosts to innovation, even in the face of higher public debt).

Future editions of the GII will track these developments closely and continue the journey toward enabling policy and business leaders by fostering a better understanding and measurement of innovation.

Notes

- 1 It is important to remember that various factors, including changes to the methodology for the calculation of indicators, data availability and changes to the GII model and measurement framework, influence the year-on-year comparisons of GII ranking. See Appendix I for more details.
- 2 Nine economies are no longer innovation achievers in 2021, relative to 2020: three economies from Europe (North Macedonia, Montenegro and Serbia); two from Latin America and the Caribbean (Costa Rica and Jamaica); two from Northern Africa and Western Asia (Armenia and Georgia); and two from sub-Saharan Africa (Mozambique and Niger).
- 3 Angola (132nd) rejoins the innovation ranking in 2021, thanks to improved availability of innovation data. The last time Angola was included in the GII was in 2015.
- 4 S&T output growth refers to the net S&T output over time, which is the difference in total patents and publications for each cluster, for all points that were located inside the same cluster compared to the previous year.

GII 2021 Economy profiles

The following tables provide detailed profiles for 132 economies

Source: Global Innovation Index 2021, WIPO.

How to read the Economy profiles

The following tables provide detailed profiles for each of the 132 economies in the Global Innovation Index 2021. They are composed of four sections.

1 | The top section provides the overall Global Innovation Index (GII) rank for each economy.

2 | The next section provides eight key metrics at the beginning of each profile that are intended to put the economy into context. They present the Innovation Output Sub-Index rank, Innovation Input Sub-Index rank, the income group to which the economy belongs, its geographical region,¹ population in millions,² GDP in billion US\$ PPP, and GDP per capita in US\$ PPP.³ The last metric provides the GII 2020 rank for the economy.

Because economies may drop out of or enter the GII, and due to adjustments made to the GII framework every year and other technical factors not directly related to actual performance (missing data, updates of data, etc.), the GII rankings are not directly comparable from one year to the next. Please refer to Appendix I for details.

The Innovation Input Sub-Index rank is computed based on the simple average of the scores in the first five pillars, while the Innovation Output Sub-Index rank is computed based on the simple average of the scores in the last two pillars. Scores are normalized values to fall within the 0–100 range.

3 | Pillars are identified by an illustrative icon, sub-pillars by two-digit numbers and indicators by three-digit numbers. For example, indicator 1.3.1, ease of starting a business appears under sub-pillar 1.3, Business environment, which in turn appears under the pillar, Institutions .

The 2021 GII includes 81 indicators and three types of data. Composite (or index) indicators are identified with an asterisk (*), survey questions are identified with a dagger (†), and the remaining indicators are all hard data series.

As far as possible, we provide the original value of the indicators (frequently scaled in our index). This has been achievable for all hard data (with the exception of indicators in sub-pillar 7.3, for which the raw data were

provided on condition that only the normalized scores were published), meaning that 56 indicators are reported as values. Normalized scores in the 0–100 range are provided for the 25 other indicators (which often consist of survey data or indices) as well as for the overall index, sub-pillars and pillars.

When data are either not available or out of date, “n/a” is used with a cutoff year of 2011, with a few exceptions. To the right of the indicator name, a clock symbol is used to indicate that the economy’s data for that indicator are older than the base year. For information on data exceptions and limitations and a detailed explanation of

the GII framework, see Appendix I. For further details on the indicators’ sources and definitions, see Appendix III.

4 | On the far right-hand side of each column, strengths of the economy in question are indicated by a solid circle ● and weaknesses by a hollow circle ○. Strengths within the economy’s income group are indicated by a solid diamond ◆ and weaknesses by a hollow diamond ◇. The only exceptions to the income group strengths and weaknesses are the top 25 high-income economies, whose strengths and weaknesses are computed within the top 25 group.⁴

For that same economy, income group weaknesses \diamond are those scores that are below the income group average minus the standard deviation within the group.

In addition, economies with a sub-pillar that does not meet the DMC requirement will show the score for that sub-pillar within square brackets. Those that have more than one sub-pillar that fails to meet the DMC requirement in the same pillar will also show the ranks of the pillar where these are located within square brackets. For these pillars and sub-pillars, strengths/weaknesses are not signaled.

Notes

- 1 Economies are classified according to the World Bank Income Group Classification (June 2020). Geographic regions correspond to the United Nations publication on standard country or area codes for statistical use (M49), as follows: EUR = Europe; NAC = Northern America; LCN = Latin America and the Caribbean; CSA = Central and Southern Asia; SEAO = South East Asia, East Asia, and Oceania; NAWA = Northern Africa and Western Asia; SSF = Sub-Saharan Africa.
- 2 Data are from the United Nations, Department of Economic and Social Affairs, Population Division, World Population Prospects: The 2019 Revision.
- 3 Data for GDP and GDP per capita are from the International Monetary Fund's World Economic Outlook 2020 database.
- 4 As the only economy in the top 25 that does not fall within the high-income group, China's income group strengths and weaknesses are computed within the non-top 25 group.
- 5 Data stringency requirements are used in the attribution of strengths and weaknesses at the sub-pillar level. These levels were revised in 2019. When economies do not meet a DMC requirement at the sub-pillar level (for sub-pillars with two indicators, the DMC is 2; for three it is 2; for four it is 3; and for five it is 4), no strength or weakness is attributed to them at the sub-pillar level. Furthermore, if the economy in question does not meet the DMC requirements at the sub-pillar level, but it still obtains a ranking higher than or equal to 10, or a ranking equal to or lower than 100 at the sub-pillar level, for the sake of caution this rank is shown in brackets. This is to ensure that incomplete data coverage does not lead to erroneous conclusions being drawn about strengths or weaknesses, or, particularly, about strong or weak sub-pillar rankings.

Output rank	Input rank	Income	Region	Population (mn)	GDP, PPP\$ (bn)	GDP per capita, PPP\$	GII 2020 rank

Appendices

Appendix I

The Global Innovation Index rational and origins, its conceptual framework and data limitations

Rationale and origins

The Global Innovation Index (GII) was launched in 2007 (see Box Annex 1). The goal was to find and determine metrics and methods that could capture a picture of innovation in society that is as complete as possible.

There were several motivations for setting this goal. First, innovation is important for driving economic progress and competitiveness – both for developed and developing economies. Many governments are putting innovation at the center of their growth strategies. Second, the definition of innovation has broadened – it is no longer restricted to research and development (R&D) laboratories and published scientific papers. Innovation is more general and horizontal in nature, and includes social, business model and technical aspects. Last, but not least, recognizing and celebrating innovation in emerging markets is critical for inspiring people – especially the next generation of entrepreneurs and innovators.

Box Annex 1: History of the GII (2007–2021)

The GII project was launched by Professor Soumitra Dutta in 2007 during his tenure at INSEAD. WIPO started its association with the GII in 2011 and began co-publishing the GII in 2012. In 2013, Cornell University joined as co-publisher, with Professor Dutta representing the GII at Cornell University and Bruno Lanvin at INSEAD. The GII continued to be co-published by Cornell University, INSEAD and WIPO up to 2020. As of 2021, the GII is published by WIPO in partnership with the Portulans Institute, various corporate and academic network partners and the GII Advisory Board.

Now in its 14th edition, the GII helps to create an environment in which innovation factors are under continual evaluation. It provides a key tool for decision-makers and a rich database of detailed metrics that are convenient for refining innovation policies.

Measuring innovation outputs and their impact remains difficult, hence great emphasis is placed on measuring the climate and infrastructure for innovation and on assessing related outcomes.

Although the final results take the shape of several rankings, the GII is more concerned with improving the “journey” to better measurement, understanding innovation, and identifying targeted policies, good practices and other levers that foster innovation. The rich data metrics, at index, sub-index or indicator level, can be used to monitor performance over time and to benchmark developments against economies within the same region or income group classification.

Defining innovation in the GII

The GII adopts a broad notion of innovation, originally elaborated in the *Oslo Manual* developed by the European Communities and the Organisation for Economic Co-operation and Development (OECD). In its fourth edition, the *Oslo Manual* 2018 introduces a more general definition of innovation:¹

An innovation is a new or improved product or process (or combination thereof) that differs significantly from the unit's previous products or processes and that has been made available to potential users (product) or brought into use by the unit (process).

This update of the *Oslo Manual* also introduces a series of definitions associated with innovation in business activities and for different types of innovation firms. In this context, innovation translates as improvements made to outcomes in the form of either new goods or services or any combination of these. While the GII focuses on a more general definition of innovation, it is important to highlight how these definitions capture the evolution of the way innovation has been perceived and understood over the last two decades.

Economists and policymakers previously focused on R&D-based technological product innovation, largely produced in-house and mostly in manufacturing industries. Innovation of this nature was executed by a highly educated labor force in R&D-intensive companies. The process leading to such innovation was conceptualized as closed, internal and localized. Technological breakthroughs were necessarily “radical” and took place at the “global knowledge frontier.” This characterization implied the existence of leading and lagging economies, with low- or middle-income economies only playing “catch up.”

Today, innovation capability is increasingly seen as the ability to exploit new technological combinations; it embraces the notion of incremental innovation and “innovation without research.” Non-R&D innovative expenditure is an important component of reaping the rewards of technological innovation. Interest in understanding how innovation evolves in low- and middle-income economies is increasing, along with an awareness that incremental forms of innovation can impact development. Furthermore, the process of innovation itself has changed significantly. Investment in innovation-related activity and intangible assets has consistently intensified at the firm, economy and global levels, adding both new innovation actors from outside high-income economies and non-profit actors. The structure of knowledge production activity is more complex and geographically dispersed than ever.²

A key challenge is to find metrics that capture innovation as it actually happens in the world today. Direct official measures that quantify innovation outputs remain extremely scarce. For example, there are no official statistics on the amount of innovative activity – defined as the number of new products, processes, or other innovations – for any given innovation actor, let alone for any given country (see the GII 2013, Chapter 1, Annex 1, Box 1). Most measurements also struggle to appropriately capture the innovation outputs of a wider spectrum of innovation actors, such as the services sector or public entities. This includes innovation surveys, which have contributed greatly to the measurement of innovation activities, but fail to provide a good and reliable sense of cross-economy innovation output performance, and are often not applicable to developing economies where innovation is often informal.³

The GII aims to improve the measurement of innovation in order to provide a more complete picture of innovation ecosystems across the globe.

The GII conceptual framework

The overall GII ranking is based on two sub-indices that are both equally important in presenting a complete picture of innovation; the Innovation Input Sub-Index and the Innovation Output Sub-Index. Hence, three indices are calculated:

- **Innovation Input Sub-Index:** Five input pillars capture elements of the economy that enable and facilitate innovative activities.
- **Innovation Output Sub-Index:** Innovation outputs are the result of innovative activities within the economy. Although the Output Sub-Index includes only two pillars, it carries the same weight as the Input Sub-Index in calculating the overall GII scores.
- **The overall GII score** is the average of the Input and Output Sub-Indices, on which the GII economy rankings are then produced.

Each of the five input and two output pillars is divided into three sub-pillars, each of which is composed of individual indicators, a total of 81 this year (see the Economy profiles section for the Framework of the Global Innovation Index 2021). A deeper elaboration of the conceptual framework and pillars can be found in last year’s edition.⁴ Sub-pillars are calculated using the weighted average of its individual indicators and are normalized to take the form of scores between 0 and 100. Pillar scores are calculated using the weighted average of its sub-pillar scores.

Adjustments to the GII model in 2021

Annex Table 1 summarizes adjustments to the GII 2021 framework. A total of 11 indicators were modified this year. The methodology of five indicators changed, three are new indicators, two indicators were dropped, and one indicator changed name.

Annex Table 1
Changes to the GII 2021 framework

GII 2020	Adjustment	GII 2021
4.2.3 Venture capital deals/bn PPP\$ GDP	Methodology revised	4.2.3 Venture capital investors, deals/bn PPP\$ GDP
	New indicator	4.2.4 Venture capital recipients, deals/bn PPP\$ GDP
4.3.2 Intensity of local competition [†]	Removed	
	New indicator	4.3.2 Domestic industry diversification
5.2.4 JV–strategic alliance deals/bn PPP\$ GDP	Methodology revised	5.2.4 Joint venture/strategic alliance deals/bn PPP\$ GDP
6.1.4 Scientific & technical articles/bn PPP\$ GDP	Methodology revised	6.1.4 Scientific and technical articles/bn PPP\$ GDP

Notes: Refer to the Sources and definitions (Appendix III) for a detailed explanation of terminology and acronyms.

Data limitations and treatment

This year the GII model includes 132 economies, which represent 94.3% of the world’s population and 99.0% of the world’s GDP in purchasing power parity current international dollars.

The timeliest possible indicators are used for the GII 2021: from the non-missing data, 30.0% are from 2020, 41.4%

are from 2019, 17.5% are from 2018, 5.9% are from 2017, 1.2% are from 2016, and the small remainder of 4.0% are from earlier years.⁵

The GII 2021 model includes 81 indicators, which fall into three categories:

- quantitative/objective/hard data (63 indicators);
- composite indicators/index data (15 indicators); and
- survey/qualitative/subjective/soft data (3 indicators).

This year, for an economy to feature in the GII 2021, the minimum symmetric data coverage is at least 36 indicators in the Innovation Input Sub-Index (66%) and 18 indicators in the Innovation Output Sub-Index (66%), with scores for at least two sub-pillars per pillar. In the GII 2021, 132 economies had sufficient data available to be included in the Index. For each economy, only the most recent yearly data were considered. As a rule, the GII indicators consider data from as far back as 2011, with a few exceptions.

Missing values

For the sake of transparency and replicability of results, missing values are not estimated; they are indicated with “n/a” and are not considered in the sub-pillar score. In return, the European Commission’s Competence Centre on Composite Indicators and Scoreboards at the Joint Research Centre (JRC-COIN) audit (see Appendix II) assesses the robustness of the GII modeling choices (no imputation of missing data, fixed predefined weights and arithmetic averages) by imputing missing data, applying random weights and using geometric averages. Since 2012, based on this assessment, a confidence interval has been provided for each ranking in the GII as well as the Input and Output Sub-Indices (Appendix II).

Treatment of series with outliers

Potentially problematic indicators with outliers that could polarize results and unduly bias the rankings were treated according to the rules listed below, as per the recommendations of the JRC-COIN. Only hard data indicators were treated (32 out of 63).

First rule: selection

Problematic indicators were identified by skewness and kurtosis. The problematic indicators had:

- an absolute value of skewness greater than 2.25; and
- a kurtosis greater than 3.5.⁶

Second rule: treatment

Indicators with one to five outliers (30 cases) were winsorized; the values distorting the indicator distribution were assigned the next highest value, up to the level where skewness and/or kurtosis had the values specified above.⁷

Indicators with five or more outliers and for which skewness or kurtosis did not enter within the ranges specified above were transformed using natural logarithms after multiplication by a given factor f .⁸ Since only “goods” were affected (i.e., indicators for which higher values indicate better outcomes, as opposed to “bads”), the following formula was used:

$$\ln \left[\frac{(max \times f - 1) (economy\ value - min)}{max - min} + 1 \right]$$

where “min” and “max” are the minimum and maximum indicator sample values.⁹

Normalization

The 81 indicators were then normalized into the [0, 100] range, with higher scores representing better outcomes. Normalization was according to the min–max method, where the “min” and “max” values were the minimum and maximum indicator sample values, respectively. Index and survey data were exceptions; the original series range of values was kept as min and max values ([0, 1] for UNPAN indices; [1, 7] for the World Economic Forum Executive Opinion Survey questions; [0, 100] for World Bank’s World Governance Indicators; etc.). The following formulas were applied:

$$\text{Goods: } \frac{economy\ value - min}{max - min} \times 100$$

$$\text{Bads: } \frac{max - economy\ value}{max - min} \times 100$$

Caveats on the year-to-year comparison of rankings

The GII compares the performance of national innovation systems across economies and presents the changes in economy rankings over time.

Importantly, scores and rankings from one year to the next are not directly comparable. Each ranking reflects the relative positioning of a particular economy based on the conceptual framework, the data coverage and the sample of economies of that GII edition, also reflecting changes in the underlying indicators at source and in data availability.

A few factors influence year-on-year rankings of an economy:

- the actual performance of the economy in question;
- adjustments made to the GII framework (changes in indicator composition and measurement revisions);
- data updates, the treatment of outliers, and missing values; and
- the inclusion or exclusion of economies in the sample.

Additionally, the following characteristics complicate the time-series analysis based on simple GII rankings or scores:

- **Missing values.** The GII produces relative index scores, which means that a missing value for one economy affects the index score of other economies. Because the number of missing values decreases every year, this problem reduces over time.
- **Reference year.** The data underlying the GII do not refer to a single year but to several years, depending on the latest available year for any given variable. In addition, the reference years for different variables are not the same for each economy, in an attempt to limit the number of missing data points.
- **Normalization factor.** Most GII variables are normalized using either GDP or population, with the intention of enabling cross-economy comparability. Yet, this implies that year-on-year changes in individual indicators may be driven either by the variable (numerator) or by its normalization factor (denominator).
- **Consistent data collection.** Measuring the change in year-on-year performance relies on the consistent collection of data over time. Changes in the definition of variables or in the data collection process could create movements in the rankings that are unrelated to performance.

A detailed economy study based on the GII database and the economy profile over time, coupled with analytical work on the ground, including that of innovation actors and decision-makers, yields the best results in terms of monitoring an economy's innovation performance, as well as in identifying possible avenues for improvement.

Notes:

- 1 Eurostat and OECD, 2018.
- 2 See WIPO (2011–2021) for bi-annual elaborations on the changing nature and geographic dispersion of innovation. See Arundel et al. (2021) for an elaboration on the role and measurement of knowledge and technology transfer between innovation actors.
- 3 On innovation in the informal economy, see Kraemer-Mbula and Wunsch-Vincent (2017).
- 4 See WIPO (2020), Appendix 1: https://www.wipo.int/edocs/pubdocs/en/wipo_pub_gii_2020-appendix1.pdf.
- 5 The GII is calculated based on 9,647 data points out of a possible 10,692 (132 economies multiplied by 81 indicators), implying that 9.8% of data points are missing. The Sources and Definitions (Appendix III) include the range of years used for each indicator. If an indicator for an economy is missing, it is marked as “n/a” in the Economy profiles.
- 6 Based on Groeneveld and Meeden (1984), which sets the criteria of absolute skewness above 1 and kurtosis above 3.5. The skewness criterion was relaxed to account for the small sample at hand (132 economies).
- 7 This distributional issue affects the following variables: 2.1.5, 3.2.1, 4.2.2, 5.2.3, 5.2.4, 5.3.2, 5.3.3, 5.3.4, 6.1.5, 7.2.2, 7.2.4 and 7.3.1 (1 outlier); 2.2.3, 5.3.1 and 7.1.3 (2 outliers); 4.2.4, 6.1.3, 6.3.4, 7.1.1, 7.2.1, 7.3.2 and 7.3.4 (3 outliers); 5.2.5, 6.3.1 and 7.2.5 (4 outliers); and 4.2.3, 6.1.1, 6.1.2 and 6.3.3 (5 outliers). An exception was made this year by also winsorizing an indicator that had six outliers: 4.1.3.
- 8 Indicators 2.3.3 and 4.3.3 were treated using log-transformation (factor f of 1).
- 9 This formula achieves two things: converting all series into “goods” and scaling the series to the range [1, max] so that natural logs are positive starting at 0, where “min” and “max” are the minimum and maximum indicator sample values. The corresponding formula for “bads” is:

$$\ln \left[\frac{(\max \times f - 1) \times (\max - \text{economy value})}{\max - \min + 1} \right]$$

Appendix II

Joint Research Centre (JRC) statistical audit of the 2021 Global Innovation Index

Michaela Saisana, Ana Rita Neves, Valentina Montalto, Giulio Caperna and Giacomo Damioli,
European Commission, JRC, Ispra, Italy

Conceptual and practical challenges are inevitable when trying to understand and model the fundamentals of innovation at the national level worldwide. Now in its 14th edition, the Global Innovation Index (GII) 2021 takes up these conceptual challenges and also deals with the practical challenges relating to data quality and methodological choices.

This appendix summarises the comprehensive audit of the GII, conducted for the eleventh consecutive year by the European Commission's Competence Centre on Composite Indicators and Scoreboards (COIN) at the Joint Research Centre (JRC) in Ispra.

As in previous editions, the present JRC-COIN audit focuses on the statistical soundness of the multi-level structure of the index as well as on the impact of key modeling assumptions on the results. The independent statistical assessment of the GII provided by the JRC-COIN guarantees the transparency and reliability of the index for both policymakers and other stakeholders, thus facilitating more accurate priority setting and policy formulation in the innovation field.

As in past GII reports, the JRC-COIN analysis complements the economy rankings with confidence intervals for the GII, the Innovation Input Sub-Index and the Innovation Output Sub-Index, in order to better appreciate the robustness of these rankings to the computation methodology. Finally, the JRC-COIN analysis includes an assessment of the added value of the GII and a measure of "distance to the efficiency frontier" of innovation by using data envelopment analysis. This is a shortened version of the audit, the full audit is available at https://www.wipo.int/edocs/pubdocs/en/wipo_pub_gii_2021-appendix1.pdf.

Main conclusions

The JRC-COIN analysis suggests that the conceptualized multilevel structure of the GII 2021 – with its 81 indicators, 21 sub-pillars, 7 pillars and 2 sub-indices comprising the overall index – is statistically sound and balanced: that is, each sub-pillar makes a similar contribution to the variation of its respective pillar. The refinements made by the developing team have helped to enhance the already strong statistical coherence in the GII framework, in which the capacity of the 81 (but two) indicators to distinguish economies' performance is maintained at the sub-pillar level or higher in all but two cases.

The decision not to impute missing values, which is common in comparable contexts and justified on the grounds of transparency and replicability, can at times have an undesirable impact on some economy scores, with the additional negative side-effect that it might encourage economies not to report low data values. The GII team's adoption, in 2016, of a more stringent data coverage threshold (at least 66 percent data availability for each of the input- and output-related indicators, separately) has notably improved confidence in the economy rankings for the GII and the two sub-indices.

Additionally, the GII team's decision, in 2012, to use weights as scaling coefficients during the index development constitutes a significant departure from the traditional, yet erroneous, vision of weights as a reflection of indicators' importance in a weighted average. It is hoped that such an approach will be adopted by other developers of composite indicators to avoid situations where bias sneaks in when least expected.

The strong correlations between the GII components are proven not to be a sign of redundancy of information in the GII. For more than 43 percent (up to 65 percent) of the 132 economies included in the GII 2021, the GII ranking and the rankings of any of the 7 pillars differ by 10 positions or more. This demonstrates the added value of the GII ranking, which helps to highlight other components of innovation that are not immediately apparent from an analysis of the seven pillars separately. At the same time, this finding points to the value of duly considering the merits of the GII pillars, sub-pillars and their constituent indicators individually. By doing so, economy-specific strengths and bottlenecks in innovation can be identified and serve as an input for evidence-based policymaking.

To test the impact of the GII modeling assumptions, a number of different models were tested in this audit based on different approaches to imputing of missing data, aggregation at the pillar level and assignment of weights. Using these models, the 90 percent confidence intervals relating to the ranking positions that an economy might have had under different model assumptions were computed. For the vast majority of economies these intervals are sufficiently narrow to allow meaningful inferences to be drawn: the intervals comprise fewer than 10 positions for 80 percent (106 out of 132) of the economies. Some caution is needed when considering two economies – Brunei Darussalam and the United Republic of Tanzania – which have GII rankings that are highly sensitive to the methodological choices. Consequently, their GII ranks – between the 82nd (Brunei Darussalam) and 90th position (United Republic of Tanzania) in the GII classification – should be interpreted cautiously and certainly not taken at face value. This is a remarkable improvement compared to GII versions up to 2016, when more than 40 economies had confidence interval widths of more than 20 positions. The improvement in the confidence that can be placed in the GII 2021 rankings is the direct result of the decision to

adopt a more stringent criterion for an economy's inclusion since 2016, which now requires at least 66 percent data availability within each of the two sub-indices. Some caution is also warranted in regard to the Input Sub-Index for seven economies – Algeria, Belarus, Botswana, Brunei Darussalam, Cabo Verde, Mauritius and the Plurinational State of Bolivia – that have 90 percent confidence interval widths of more than 20 positions (up to 31 for Botswana). A similar degree of caution is also needed in the Output Sub-Index for four economies – Brunei Darussalam, Malawi, Togo and the United Republic of Tanzania – that have 90 percent confidence interval widths of more than 20 positions (up to 40 for Tanzania). Compared to the GII 2019, the higher data availability in the Output Sub-Index this year has led to a much lower number of economies with very wide intervals (4 compared to 13 in the GII 2019 edition), which is a noteworthy improvement.

Although ranks for a few economies, in the GII 2021 overall or in the two sub-indices, appear to be sensitive to the methodological choices, the published rankings for the vast majority can be considered to be representative of the plurality of scenarios simulated in this audit. Taking the median rank as the benchmark for an economy's expected rank in the realm of the GII's unavoidable methodological uncertainties, 75 percent of the economies are found to shift fewer than three positions with respect to the median rank in the GII, or in the Input and Output Sub-Indices.

In order to offer full transparency and complete information, Annex Table 2 reports the GII 2021 Index and Input and Output Sub-Indices' economy ranks together with the simulated 90 percent confidence intervals to allow a better appreciation of the robustness of the results to the choice of weights and aggregation formula and the impact of estimating missing data (where applicable).

All things considered, the present JRC-COIN audit findings confirm that the GII 2021 meets international quality standards for statistical soundness, which indicates that the GII is a reliable benchmarking tool for innovation practices at the economy level around the world.

Finally, the “distance to the efficiency frontier” measure calculated using data envelopment analysis can be used both as a measure of efficiency and as a suitable approach to benchmarking economies' multidimensional performance on innovation without imposing a fixed and common set of weights that may not be fair to a particular economy. The decision made by the GII team to abandon the efficiency ratio (ratio of Output to Input Sub-Index) is particularly laudable. In fact, ratios of composite indicators (Output to Input Sub-Index in this case) come with much higher uncertainty than the sum of the components (Input plus Output Sub-Index, equivalent to the GII). For this reason, developers and users of indices alike need to approach efficiency ratios of this nature with

great care. The GII should not represent the ultimate and definitive ranking of economies with respect to innovation. On the contrary, the GII best represents an ongoing attempt to find metrics and approaches that capture the richness of innovation more effectively, continuously adapting the GII framework to reflect the improved availability of statistics and the theoretical advances in the field. In any case, the GII should be regarded as a sound attempt, based on the principle of transparency, matured over 14 years of constant refinements, to pave the way for better and more informed innovation policies worldwide.

Appendix III Sources and definitions

This appendix complements the Economy profiles and the online data tables by providing the title, description, definition and source for each of the 81 indicators included in the Global Innovation Index (GII) this year.

For all 132 economies in the GI in 2021, the most recent values, within the period 2011 to 2020, were used for each indicator, with a few noted exceptions (see Appendix I). The year provided next to the indicator description (directly below the indicator title) corresponds to the year when data were most frequently available for economies. When more than one year is considered, the period used is indicated at the end of the indicator's source in parentheses.

Of the 81 indicators, 63 variables are hard data, 15 are composite indicators, marked with (*), and 3 are survey questions from the World Economic Forum's Executive Opinion Survey (EOS), marked with (!). In some cases, additional markings are provided at the end of the indicator description. Instances marked with ^a signal indicators that were assigned half weights and those marked ^b are indicators where higher scores indicate poorer outcomes, commonly known as "bads." Appendix I presents more details on the computation.

Some indicators are scaled during computation to make them comparable across economies. Indicators are scaled either in relation to other comparable indicators or through division by gross domestic product (GDP) in current U.S. dollars, purchasing power parity GDP in international dollars (PPP\$ GDP), population, total trade, etc. In all cases, the scaling factor used was the value that corresponded to the same year of the indicator.

1. Institutions

1.1. Political environment

1.1.1. Political and operational stability*

Political, legal, operational or security risk index^{*ab} | 2020

Index that measures the likelihood and severity of political, legal, operational or security risks affecting business operations. Scores are annualized and standardized.

Source: IHS Markit, *Country Risk Scores*, aggregated for end Q1, Q2, Q3 and Q4 2020. (<https://ihsmarkit.com/industry/economics-country-risk.html>).

1.1.2. Government effectiveness*

Government effectiveness index* | 2019

Index that reflects perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies. Scores are standardized.

Source: World Bank, *Worldwide Governance Indicators*, 2019 update. (<http://info.worldbank.org/governance/wgi/#home>).

1.2. Regulatory environment

1.2.1. Regulatory quality*

Regulatory quality index^{*a} | 2019

Index that reflects perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private-sector development. Scores are standardized.

Source: World Bank, *Worldwide Governance Indicators*, 2019 update. (<http://info.worldbank.org/governance/wgi/#home>).

1.2.2. Rule of law*

Rule of law index^{*a} | 2019

Index that reflects perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police and the courts, as well as the likelihood of crime and violence. Scores are standardized.

Source: World Bank, *Worldwide Governance Indicators*, 2019 update. (<http://info.worldbank.org/governance/wgi/#home>).

1.2.3. Cost of redundancy dismissal

Sum of notice period and severance pay for redundancy dismissal (salary in weeks, averages for workers with 1, 5 and 10 years of tenure, with a minimum threshold of 8 weeks)^b | 2019

Redundancy costs measure the cost of advance notice requirements and severance payments due when terminating a redundant worker, expressed in weeks of salary. The average value of notice requirements and severance payments applicable to a worker with 1 year of tenure, a worker with 5 years, and a worker with 10 years are also considered. One month is recorded as 4 and 1/3 weeks. If the redundancy cost adds up to 8 or fewer weeks of salary, a value of 8 is assigned but the actual number of weeks is published. If the cost adds up to more than 8 weeks of salary, the score is the number of weeks.

Source: World Bank, *Doing Business 2020, Comparing Business Regulation in 190 Economies*. The World Bank has temporarily suspended its *Doing Business* data collection but it will be resumed at a later stage. (<https://www.doingbusiness.org/en/reports/global-reports/doing-business-2020>).

1.3. Business environment

1.3.1. Ease of starting a business*

Ease of starting a business* | 2019

The ranking of economies on the ease of starting a business is determined by sorting their scores. These scores are the simple average of the scores for each of the component indicators. The World Bank's *Doing Business* records all procedures officially required, or commonly undertaken in practice, for an entrepreneur to start up and formally operate an industrial or commercial business, as well as the time and cost to complete these procedures and the paid-in minimum capital requirement. These procedures include obtaining all necessary licenses and permits and completing any required notifications, verifications or inscriptions for the company and employees with relevant authorities. Data are collected from limited liability companies based in the largest business cities. For 11 economies, namely Bangladesh, Brazil, China, India, Indonesia, Japan, Mexico, Nigeria, Pakistan, the Russian Federation and the United States of America, the data are also collected for the second-largest business cities.

Source: World Bank, *Doing Business 2020, Comparing Business Regulation in 190 Economies*. The World Bank has temporarily suspended its *Doing Business* data collection but it will be resumed at a later stage. (<https://www.doingbusiness.org/en/reports/global-reports/doing-business-2020>).

1.3.2. Ease of resolving insolvency*

Ease of resolving insolvency* | 2019

Doing Business studies the time, cost and outcome of insolvency proceedings involving domestic legal entities. These variables are used to calculate the recovery rate, which is recorded as cents on the dollar recovered by secured creditors through reorganization, liquidation or debt enforcement (foreclosure or receivership) proceedings. To determine the present value of the amount recovered by creditors, *Doing Business* uses the lending rates from the International Monetary Fund, supplemented with data from central banks and the Economist Intelligence Unit.

The data for the resolving insolvency indicators are derived from questionnaire responses by local insolvency practitioners and verified through a study of laws and regulations as well as public information on insolvency systems. The ranking of economies on the ease of resolving insolvency is determined by taking the simple average of their scores for the recovery rate and the strength of the insolvency framework index. More information on the methodology is available on the *Doing Business* website (<https://www.doingbusiness.org/en/methodology/resolving-insolvency>).

Source: World Bank, *Doing Business 2020, Comparing Business Regulation in 190 Economies*. The World Bank has temporarily suspended its *Doing Business* data collection but it will be resumed at a later stage. (<https://www.doingbusiness.org/en/reports/global-reports/doing-business-2020>).

2. Human capital and research

2.1. Education

2.1.1. Expenditure on education, % GDP

Government expenditure on education (% of GDP) | 2017

Total general (local, regional and central) government expenditure on education (current, capital and transfers), expressed as a percentage of GDP. It includes expenditure funded by transfers from international sources to government.

Source: UNESCO Institute for Statistics (UIS) online database and Eurostat (2010–19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>).

2.1.2. Government funding/pupil, secondary, % GDP/cap

Government funding per secondary pupil (% of GDP per capita) | 2017

Average total (current, capital and transfers) general government expenditure per student, at secondary level, expressed as a percentage of GDP per capita.

Source: UNESCO Institute for Statistics (UIS) online database (2010–19). (<http://data.uis.unesco.org>).

2.1.3. School life expectancy, years

School life expectancy, primary to tertiary education, both sexes (years) | 2018

Total number of years that a person of school entrance age can expect to spend within the primary to tertiary levels of education. For a child of a given age, the school life expectancy is calculated as the sum of the age-specific enrolment rates for primary to tertiary levels of education. The part of the enrolment that is not distributed by age is divided by the school-age population for the primary to tertiary level of education in which they are enrolled and multiplied by the duration of that level of education. The result is then added to the sum of the age-specific enrolment rates. A relatively high value indicates a greater probability of children spending more years in education and a higher overall retention rate within the education system. It must be noted that the expected number of years does not necessarily coincide with the expected number of grades of education completed due to grade repetition.

Source: UNESCO Institute for Statistics (UIS) online database (2010–20). (<http://data.uis.unesco.org>).

2.1.4. PISA scales in reading, maths and science

PISA scales in reading, mathematics and science^a | 2018

PISA is the OECD's (Organisation for Economic Co-operation and Development) Programme for International Student Assessment. PISA measures 15-year-olds' ability to use their reading, mathematics and science knowledge skills. Results from PISA indicate the quality and equity of learning outcomes attained around the world. The 2018 PISA survey is the seventh round of the triennial assessment.

The indicator is built using the average of the reading, mathematics and science scores for each country. PISA scores are set in relation to the variation in results observed across all test participants in a country. There is, theoretically, no minimum or maximum score in PISA; rather, the results are scaled to fit approximately normal distributions, with means around 500 score points and standard deviations around 100 score points.

The 2018 scores for China correspond to the provinces/municipalities of Beijing, Shanghai, Jiangsu and Zhejiang only. The 2018 scores for Azerbaijan correspond only to the capital Baku. The 2018 average scores for Spain are based only on the scores for mathematics and science, as the reading scores were not published by the OECD due to implausible student response behavior.

Source: OECD Programme for International Student Assessment (PISA) (2015–18). (www.pisa.oecd.org).

2.1.5. Pupil–teacher ratio, secondary

Pupil–teacher ratio, secondary^{ab} | 2019

The number of pupils enrolled in secondary school divided by the number of secondary school teachers (regardless of their teaching assignment). Where the data are missing for the secondary education level as a whole, the ratios for upper-secondary are reported; if these are also missing, the ratios for lower-secondary are reported instead. A high pupil–teacher ratio suggests that each teacher has to be responsible for a large number of pupils. In other words, the higher the pupil–teacher ratio, the lower the relative access of pupils to teachers.

Source: UNESCO Institute for Statistics (UIS) online database (2010–20). (<http://data.uis.unesco.org>).

2.2. Tertiary education

2.2.1. Tertiary enrolment, % gross

School enrolment, tertiary (% gross) | 2018

The ratio of total tertiary enrolment, regardless of age, to the population of the age group that officially corresponds to the tertiary level of education. Tertiary education, whether or not at an advanced research qualification, normally requires, as a minimum condition of admission, the successful completion of education at the secondary level. The school enrolment ratio can exceed 100% due to grade repetition and the inclusion of under-aged and over-aged students, who are early or late entrants.

Source: UNESCO Institute for Statistics (UIS) online database (2010–20). (<http://data.uis.unesco.org>).

2.2.2. Graduates in science and engineering, %

Graduates from Science, Technology, Engineering and Mathematics programs (% of total tertiary graduates) | 2018

The share of all tertiary-level graduates in natural sciences, mathematics, statistics, information and technology, manufacturing, engineering and construction as a percentage of all tertiary-level graduates. Data for Israel, Japan, Mexico, the Republic of Korea, the United Kingdom and the United States of America are taken from the OECD Main Science and Technology Indicators database. Data for Malta, Portugal and Romania are taken from Eurostat.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat database; and OECD, Main Science and Technology Indicators (MSTI) database, March 2021 (2010–20). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB).

2.2.3. Tertiary inbound mobility, %

Tertiary inbound mobility rate (%)^a | 2018

The number of students from abroad studying in a given country as a percentage of the total tertiary-level enrolment in that country.

Source: UNESCO Institute for Statistics (UIS) online database (2010–19). (<http://data.uis.unesco.org>).

2.3. Research and development (R&D)

2.3.1. Researchers FTE/mn pop.

Researchers, full-time equivalent (FTE) (per million population) | 2019

Researchers in R&D are professionals engaged in the conception or creation of new knowledge. They conduct research and improve or develop concepts, theories, models, techniques, instrumentation, software or operational methods. Data collected from UNESCO Institute for Statistics, Eurostat and OECD Main Science and Technology Indicators.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat; OECD, Main Science and Technology Indicators (MSTI) database, March 2021 (2010–19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB).

2.3.2. Gross expenditure on R&D (GERD), % GDP

Gross expenditure on R&D (% of GDP) | 2019

Total domestic intramural expenditure on R&D during a given period as a percentage of GDP. “Intramural R&D expenditure” is all expenditure for R&D performed within a statistical unit or sector of the economy during a specific period, regardless of the source of funding. Data collected from UNESCO Institute for Statistics, Eurostat and OECD Main Science and Technology Indicators.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat, Eurostat database; OECD, Main Science and Technology Indicators (MSTI) database, 2021 (2010–19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; https://stats.oecd.org/Index.aspx?DataSet-Code=MSTI_PUB).

2.3.3. Global corporate R&D investors, top 3, mn US\$

Average expenditure of the top three global companies by R&D, million US\$ | 2020

Average expenditure on R&D of the top three global companies. If a country has fewer than three global companies listed, the figure is either the average of the sum of the two companies listed or the total for a single listed company. A score of 0 is given to countries with no listed companies. The data include economies outside the European Union (EU).

Source: The 2020 EU Industrial R&D Investment Scoreboard. (<https://iri.jrc.ec.europa.eu/scoreboard/2020-eu-industrial-rd-investment-scoreboard>).

2.3.4. QS university ranking, top 3*

Average score of the top three universities according to the QS world university ranking* | 2020

Average score of the top three universities per country. If fewer than three universities are listed in the QS ranking of the global top 1,000 universities, the sum of the scores of the listed universities is divided by three, thus implying a score of zero for the non-listed universities. The 2021 ranking corresponds to data extracted in 2020.

Source: QS Quacquarelli Symonds Ltd, *QS World University Ranking, Top Universities*. (<https://www.topuniversities.com/university-rankings/world-university-rankings/2021>).

3. Infrastructure

3.1. Information and communication technologies (ICTs)

3.1.1. ICT access*

ICT access index^a | 2019

The ICT access index, previously part of the International Telecommunication Union (ITU) ICT Development Index, is a composite index that weights five ICT indicators (20% each): (1) Fixed telephone subscriptions per 100 inhabitants; (2) Mobile cellular telephone subscriptions per 100 inhabitants; (3) International Internet bandwidth (bit/s) per Internet user; (4) Percentage of households with a computer; and (5) Percentage of households with Internet access.

Source: GII calculations based on the World Telecommunication/ICT Indicators Database (released January 2020) following the methodology of the ITU ICT Development Index 2017. (<https://www.itu.int/en/ITU-D/Statistics/Pages/publications/mis2017.aspx>).

3.1.2. ICT use*

ICT use index^a | 2019

The ICT use index, previously part of the International Telecommunication Union (ITU) ICT Development Index, is a composite index that weights three ICT indicators (one third each): (1) Percentage of individuals using the Internet; (2) Fixed (wired) broadband Internet subscriptions per 100 inhabitants; (3) Active mobile broadband subscriptions per 100 inhabitants.

Source: GII calculations based on the World Telecommunication/ICT Indicators Database (released January 2020) following the methodology of the ITU ICT Development Index 2017. (<https://www.itu.int/en/ITU-D/Statistics/Pages/publications/mis2017.aspx>).

3.1.3. Government's online service*

Government's online service index^a | 2020

The Online Services Index component of the E-Government Development Index is a composite indicator measuring the use of ICTs by governments in delivering public services at the national level. To arrive at a set of Online Service Index values for 2020, a total of 215 online United Nations Volunteer researchers from 96 countries, covering 66 languages, assessed each country's national website in the native language, including the national portal, e-services portal and e-participation portal, as well as the websites of the related ministries of education, labor, social

services, health, finance and environment, as applicable. The total number of points scored by each country is normalized to a range of 0 to 1. The online index value for a given country is equal to the actual total score less the lowest total score divided by the range of total score values for all countries.

Note: The precise meaning of these values varies from one edition of the Survey to the next, as understanding of the potential of e-government changes and the underlying technology evolves. See the link below for more details.

Source: United Nations Public Administration Network, *E-Government Survey 2020*. (<https://publicadministration.un.org/egovkb/en-us/Reports/UN-E-Government-Survey-2020>).

3.1.4. E-participation*

Online E-Participation Index^a | 2020

The E-Participation Index (EPI) is derived as a supplementary index to the United Nations E-Government Survey. It extends the scope of the Survey by focusing on government use of online services in providing information to its citizens (“e-information sharing”), interacting with stakeholders (“e-consultation”) and engaging in decision-making processes (“e-decision-making”). A country’s EPI reflects the e-participation mechanisms that are deployed by its government in comparison to all other countries. The purpose of this measure is not to prescribe any specific practice, but rather to offer insight into how different countries are using online tools to promote interaction between government and citizens, as well as between citizens, for the benefit of all. As the EPI is a qualitative assessment based on the availability and relevance of participatory services available on government websites, the comparative ranking of countries is for illustrative purposes only and serves as an indicator of the broad trends in promoting citizen engagement. The index ranges from 0 to 1, with 1 showing greater e-participation. Mathematically, the EPI is normalized by taking the total score value for a given country, subtracting the lowest total score for any country in the survey and dividing by the range of total score values for all countries.

Note: The precise meaning of these values varies from one edition of the Survey to the next, as understanding of the potential of e-government changes and the underlying technology evolves. See the link below for more details.

Source: United Nations Public Administration Network, *E-Government Survey 2020*. (<https://publicadministration.un.org/egovkb/en-us/Reports/UN-E-Government-Survey-2020>).

3.2. General infrastructure

3.2.1. Electricity output, GWh/mn pop.

Electricity output (GWh per million population)^a | 2018

Electricity production, measured at the terminals of all alternator sets in a station. In addition to hydropower, coal, oil, gas and nuclear power generation, this indicator covers generation by geothermal, solar, wind, tide and wave energy, as well as that from combustible renewables and waste. Production includes the output of plants that are designed to produce solely electricity as well as the output of combined heat and power plants. Electricity output in GWh is scaled by population.

Source: International Energy Agency (IEA) *World Energy Balances*, July 2020 edition and February 2021 edition (selected economies) (2018–19). (<https://www.iea.org/reports/world-energy-balances-overview>).

3.2.2. Logistics performance*

Logistics Performance Index^a | 2018

A multidimensional assessment of logistics performance, the Logistics Performance Index (LPI) ranks 160 countries, combining data on six core performance components into a single aggregate measure including customs performance, infrastructure quality and timeliness of shipments. The data used in the ranking come from a survey of logistics professionals who are asked questions about the foreign countries in which they operate. The LPI’s six components are: (1) Customs: the efficiency of customs and border management clearance; (2) Infrastructure: the quality of trade and transport infrastructure; (3) International shipments: the ease of arranging competitively priced shipments; (4) Services quality: the competence and quality of logistics services; (5) Tracking and tracing: the ability to track and trace consignments; and (6) Timeliness: the frequency with which shipments reach consignees within scheduled or expected delivery times. The LPI therefore consists of both qualitative and quantitative measures and helps to build profiles of logistics friendliness for these countries.

Source: World Bank and Turku School of Economics, *Logistics Performance Index 2018*; Arvis et al., 2018, *Connecting to Compete 2018: Trade Logistics in the Global Economy – The Logistics Performance Index and its Indicators*. (<https://data.worldbank.org/indicator/LP.LPI.OVRL.XQ>; <https://openknowledge.worldbank.org/bitstream/handle/10986/29971/LPI2018.pdf>).

3.2.3. Gross capital formation, % GDP

Gross capital formation (% of GDP) | 2020

Gross capital formation is expressed as the ratio of total investment in current local currency to GDP in current local currency. Investment or gross capital formation is measured by the total value of the gross fixed capital formation and changes in inventories and acquisitions less disposals of valuables for a unit or sector, on the basis of the System of National Accounts (SNA) 1993.

Source: International Monetary Fund, World Economic Outlook Database, October 2020. (<https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases>).

3.3. Ecological sustainability

3.3.1. GDP/unit of energy use

GDP per total energy supply (per thousand 2015 PPP\$ GDP) | 2018

Purchasing power parity gross domestic product (2015 PPP\$ GDP) per total energy supply (TES). TES is made up of the cost of production + imports – exports – international marine bunkers – international aviation bunkers +/- stock changes. GDP/TES is an indicator of energy productivity.

Source: International Energy Agency (IEA) *World Energy Balances*, July 2020 edition (2018–19). (<https://www.iea.org/reports/world-energy-balances-overview>)

3.3.2. Environmental performance*

Environmental Performance Index* | 2020

The 2020 Environmental Performance Index (EPI) ranks 180 countries on different categories covering environmental health and ecosystem vitality. These indicators provide a gauge of how close countries are to achieving established environmental policy targets. The EPI offers a scorecard that highlights leaders and laggards in environmental performance and provides practical guidance for countries that aspire to move toward a sustainable future. The index ranges from 0 to 100, with 100 indicating best performance.

Source: Yale University and Columbia University, 2020 Environmental Performance Index. (<https://epi.yale.edu/epi-results/2020/component/epi>).

3.3.3. ISO 14001 environmental certificates/bn PPP\$ GDP

ISO 14001 Environmental management systems – Number of certificates issued (per billion PPP\$ GDP) | 2019

ISO 14001 specifies the requirements for an environmental management system that an organization can use to enhance its environmental performance. ISO 14001 is intended for use by an organization that is seeking to manage its environmental responsibilities in a systematic manner that contributes to the environmental pillar of sustainability. ISO 14001 helps an organization to achieve the intended outcomes of its environmental management system, providing value for the environment, the organization itself and interested parties. Consistent with the organization's environmental policy, the intended outcomes of an environmental management system include enhancement of environmental performance, fulfillment of compliance obligations and achievement of environmental objectives. ISO 14001 is applicable to any organization, regardless of size, type or nature, and applies to the environmental aspects of its activities, products and services that the organization determines it can either control or influence from a life cycle perspective. ISO 14001 does not state specific environmental performance criteria. It can be used in whole or in part to systematically improve environmental management. Claims of conformity to ISO 14001, however, are not acceptable unless all its requirements are incorporated into an organization's environmental management system and fulfilled without exclusion. The data are reported per billion PPP\$ GDP.

Source: International Organization for Standardization, *ISO Survey of Certifications to Management System Standards*, 2019; International Monetary Fund, World Economic Outlook Database, October 2020. (<https://www.iso.org/the-iso-survey.html>; <https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases>).

4. Market sophistication

4.1. Credit

4.1.1. Ease of getting credit*

Ease of getting credit* | 2019

The ranking of economies on the ease of getting credit is determined by sorting their scores for getting credit.

These scores are the score for the sum of the strength of the legal rights index (range 0–12) and the depth of credit information index (range 0–8). The World Bank's *Doing Business* measures the legal rights of borrowers and lenders with respect to secured transactions through one set of indicators and the reporting of credit information through another. The first set of indicators measures whether certain features that facilitate lending exist within the applicable collateral and bankruptcy laws. The second set measures the coverage, scope and accessibility of credit information available through credit reporting service providers, such as credit bureaus or credit registries. Although *Doing Business* compiles data on getting credit for public registry coverage (% of adults) and for private bureau coverage (% of adults), these indicators are not included in the ranking.

Source: World Bank, *Doing Business 2020, Comparing Business Regulation in 190 Economies*. The World Bank has temporarily suspended its *Doing Business* data collection but it will be resumed at a later stage. (<https://www.doingbusiness.org/en/reports/global-reports/doing-business-2020>).

4.1.2. Domestic credit to private sector, % GDP

Domestic credit to private sector (% of GDP) | 2019

Domestic credit to private sector refers to financial resources provided to the private sector by financial corporations, such as through loans, purchases of non-equity securities, and trade credits and other accounts receivable, that establish a claim for repayment. For some countries these claims include credit to public enterprises. The financial corporations include monetary authorities and deposit money banks, as well as other financial corporations where data are available (including corporations that do not allow transferable deposits but do accept such liabilities as time and savings deposits). Examples of other financial corporations are finance and leasing companies, money lenders, insurance corporations, pension funds and foreign exchange companies.

Source: International Monetary Fund, International Financial Statistics and data files; World Bank and OECD GDP estimates; extracted from the World Bank's World Development Indicators database (2010–19). (<https://data.imf.org>; <http://data.worldbank.org>).

4.1.3. Microfinance gross loans, % GDP

Microfinance institutions: Gross loan portfolio (% of GDP)^a | 2018

Combined gross loan balances of microfinance institutions (current US\$) in a country as a percentage of its GDP (current US\$).

Source: Microfinance Information Exchange, MIX Market database; International Monetary Fund, World Economic Outlook Database, October 2020 (2011–19). (<https://datacatalog.worldbank.org/dataset/mix-market>; <https://www.imf.org/external/pubs/ft/weo/2019/02/weodata/index.aspx>).

4.2. Investment

4.2.1. Ease of protecting minority investors*

Ease of protecting minority investors* | 2019

This ranking is the sum of the scores for the extent of conflict of interest regulation index and the extent of shareholder governance index. The extent of conflict of interest regulation index measures the protection of shareholders against directors' misuse of corporate assets for personal gain by distinguishing three aspects of regulation that address conflicts of interest: (1) transparency of related-party transactions (extent of disclosure index); (2) shareholders' ability to sue and hold directors liable for self-dealing (extent of director liability index); (3) access to evidence and allocation of legal expenses in shareholder litigation (ease of shareholder suits index). The extent of shareholder governance index measures shareholders' rights in corporate governance by distinguishing three aspects of good governance: (1) shareholders' rights and role in major corporate decisions (extent of shareholder rights index); (2) governance safeguards protecting shareholders from undue board control and entrenchment (extent of ownership and control index); (3) corporate transparency on ownership stakes, compensation, audits and financial prospects (extent of corporate transparency index). The index also measures whether a subset of relevant rights and safeguards are available in limited companies. The data come from a questionnaire administered to corporate and securities lawyers and are based on securities regulations, company laws, civil procedure codes and court rules of evidence.

Source: World Bank, *Doing Business 2020, Comparing Business Regulation in 190 Economies*. The World Bank has temporarily suspended its *Doing Business* data collection but it will be resumed at a later date. (<https://www.doingbusiness.org/en/reports/global-reports/doing-business-2020>).

4.2.2. Market capitalization, % GDP

Market capitalization of listed domestic companies (% of GDP, three-year average) | 2019

Market capitalization (also known as “market value”) is the share price times the number of shares outstanding (including their several classes) for listed domestic companies. Investment funds, unit trusts, and companies whose only business goal is to hold shares of other listed companies are excluded. Data are the average of the end-of-year values for the last three years.

Source: World Federation of Exchanges database; extracted from the World Bank’s World Development Indicators database (2011–19). (<https://www.world-exchanges.org/our-work/statistics>; <http://data.worldbank.org>).

4.2.3. Venture capital investors, deals/bn PPP\$ GDP

Number of venture capital deals invested in (per billion PPP\$ GDP, three-year average) | 2020

Refinitiv Eikon data on private equity deals, per deal, with information on the location of the firm investing in a venture capital (VC) deal, among other details. The data extraction corresponds to a query on VC deals between January 1, 2018 and December 31, 2020, with the data aggregated by the location of the investing firm. The data represent the three-year average of 2018–20 deals invested in and are reported per billion PPP\$ GDP.

Source: Refinitiv (a London Stock Exchange Group (LSEG) business) Eikon (private equity screener) accessed April 23, 2021; International Monetary Fund, World Economic Outlook Database, October 2020 (2018–20). (<https://solutions.refinitiv.com/eikon-trading-software>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

4.2.4. Venture capital recipients, deals/bn PPP\$ GDP

Number of venture capital deals received (per billion PPP\$ GDP, three-year average) | 2020

Refinitiv data on private equity deals, per deal, with information on the location of the firm receiving the VC investment, among other details. The data extraction corresponds to a query on VC deals between January 1, 2018 and December 31, 2020, with the data aggregated by the location invested

in. The data represent the three-year average of 2018–20 deals received and are reported per billion PPP\$ GDP.

Source: Refinitiv (an LSEG business) Eikon (private equity screener) accessed April 23, 2021; International Monetary Fund, World Economic Outlook Database October 2020 (2018–20). (<https://solutions.refinitiv.com/eikon-trading-software>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

4.3. Trade, diversification, and market scale

4.3.1. Applied tariff rate, weighted avg., %

Tariff rate, applied, weighted average, all products (%)^{ab} | 2019

Weighted average applied tariff is the average of effectively applied rates weighted by the product import shares corresponding to each partner country. Data are classified using the Harmonized System of trade at the six- or eight-digit level. Tariff line data were matched to Standard International Trade Classification (SITC) revision 3 codes to define commodity groups and import weights. As far as possible, specific rates have been converted to their ad valorem equivalent rates and have been included in the calculation of weighted average tariffs. Effectively applied tariff rates at the six- and eight-digit product level are averaged for products in each commodity group. When the effectively applied rate is unavailable, the most favored nation rate is used instead.

Source: World Bank, based on data from United Nations Conference on Trade and Development’s (UNCTAD) Trade Analysis Information System (TRAIS) database and the World Trade Organization’s (WTO) Integrated Database (IDB) and Consolidated Tariff Schedules (CTS) Database; extracted from World Bank’s World Development Indicators database (2013–19). (<http://data.worldbank.org>; <https://www.wto.org>).

4.3.2. Domestic industry diversification

Domestic industry diversification (based on manufacturing output)^b | 2018

Herfindahl-Hirschman Index (HHI) for the domestic industry defined as the sum of the squared shares of sub-sectors in total manufacturing output. The HHI is a measure of concentration and can help to determine the extent to which a country’s industrial system is diversified across different industrial sub-sectors (or, conversely, concentrated in a few industrial sub-sectors). In the context of measuring domestic industry diversification, the HHI is calculated by squaring the shares of individual

sub-sectors in total domestic manufacturing output and then summing the squares. A country with a perfectly diversified industrial system will have an index close to zero, whereas a country that is active in only one industrial sub-sector will have a value of one (least diversified). That is, the more diversified a country's industry is, the lower its HHI value will be.

Source: United Nations Industrial Development Organization (UNIDO), Industrial Statistics Database, two-digit level of International Standard Industrial Classification (ISIC) Revision 3 (INDSTAT 2 2021); EQUIP (Enhancing the Quality of Industrial Policies) *Tool 4: Diversification – Domestic and Export Dimensions*, 2015 (2011–19) (<http://stat.unido.org>; www.equip-project.org/wp-content/uploads/2015/08/EQUIP_Tool-4_V150821.pdf).

4.3.3. Domestic market scale, bn PPP\$

Domestic market scale as measured by GDP, bn PPP\$ | 2020

The domestic market size is measured by GDP based on the PPP valuation of country GDP, in current international dollars (billions).

Source: International Monetary Fund, World Economic Outlook Database, October 2020. (<https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

5. Business sophistication

5.1. Knowledge workers

5.1.1. Knowledge-intensive employment, %

Employment in knowledge-intensive services (% of workforce) | 2019

Sum of people in categories 1 to 3 as a percentage of total people employed, according to the International Standard Classification of Occupations (ISCO). Categories included in ISCO-08 are: 1 Managers; 2 Professionals; 3 Technicians and Associate Professionals. Where ISCO-08 data were not available, ISCO-88 data were used. Categories included in ISCO-88 are: 1 Legislators, senior officials and managers; 2 Professionals; 3 Technicians and associate professionals.

Source: International Labour Organization (ILO), ILOSTAT Database of Labour Statistics (2010–20). (www.ilo.org/ilostat).

5.1.2. Firms offering formal training, %

Firms offering formal training (% of firms) | 2019

The percentage of firms offering formal training programs for their permanent, full-time employees in the sample of firms in the World Bank's Enterprise Survey in each country.

Source: World Bank, Enterprise Surveys (2010–20). (www.enterprisesurveys.org).

5.1.3. GERD performed by business, % GDP

GERD: Performed by business enterprise (% of total GDP) | 2019

Gross expenditure on R&D performed by business enterprise as a percentage of GDP. For the definition of GERD, see indicator 2.3.2.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat, Eurostat database; OECD, Main Science and Technology Indicators (MSTI) database, 2019 (2010–19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB).

5.1.4. GERD financed by business, %

GERD financed by business enterprise (% of total GERD) | 2018

Gross expenditure on R&D financed by business enterprise as a percentage of total gross expenditure on R&D. For the definition of GERD, see indicator 2.3.2. Plurinational State of Bolivia and Burkina Faso use data for 2009.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat, Eurostat database; OECD, Main Science and Technology Indicators (MSTI) database, 2019 (2010–19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB).

5.1.5. Females employed w/advanced degrees, %

Females employed with advanced degrees, % total employed (25+ years old)^a | 2019

The percentage of females employed with advanced degrees out of total employed. The employed comprise all persons of working age who, during a specified brief period, were in one of the following categories: (1) paid employment; or (2) self-employment. Data are disaggregated by level of education, which refers to the highest level of education completed, classified according to the International Standard Classification of Education (ISCE). Data for Canada are based on Table 14-10-0020-01 of the country's Labour Force Survey estimates.

Source: International Labour Organization, ILOSTAT Database of Labour Statistics; Statistics Canada. Table 14-10-0020-01 Unemployment rate, participation rate and employment rate by educational attainment, annual, accessed February 10, 2020 (2011–20). (www.ilo.org/ilostat; <https://www150.statcan.gc.ca/t1/tbl1/en/tv.action?pid=1410002001>).

5.2. Innovation linkages

5.2.1. University–industry R&D collaboration[†]

The extent to which businesses and universities collaborate on R&D^{†a} | 2020

Average answer to the survey question: In your country, to what extent do businesses and universities collaborate on research and development (R&D)? [1 = not at all; 7 = to a great extent]

Source: World Economic Forum, Executive Opinion Survey 2020 (2018–20), Appendix C of *The Global Competitiveness Report 2020*. (www3.weforum.org/docs/WEF_TheGlobalCompetitivenessReport2020.pdf).

5.2.2. State of cluster development and depth[†]

How widespread clusters are[†] | 2020

Average answer to the survey question: In your country, how widespread are well-developed and deep clusters (geographic concentrations of firms, suppliers, producers of related products and services, and specialized institutions in a particular

field)? [1 = nonexistent; 7 = widespread in many fields].

Source: World Economic Forum, Executive Opinion Survey 2020 (2018–20), Appendix C of *The Global Competitiveness Report 2020*. (www3.weforum.org/docs/WEF_TheGlobalCompetitivenessReport2020.pdf).

5.2.3. GERD financed by abroad, % GDP

GERD financed by abroad (% of total GDP) | 2018

Percentage of gross expenditure on R&D financed by abroad (billions, national currency) – that is, with foreign financing as a percentage of GDP (billions, national currency). For the definition of GERD, see indicator 2.3.2.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat, Eurostat database; OECD, Main Science and Technology Indicators (MSTI) database, 2019 (2010–19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB).

5.2.4. Joint venture/strategic alliance deals/bn PPP\$ GDP

Number of joint venture/strategic alliance deals, fractional counting (per billion PPP\$ GDP, three-year average) | 2020

Refinitiv's data on joint ventures/strategic alliances, per deal, with details on the country of origin of partner firms, among others. The data extraction corresponds to a query on joint venture/strategic alliance deals between January 1, 2018 and December 31, 2020. The nation of each company participating in a deal (n companies per deal) is allocated, per deal, a score equivalent to $1/n$ (with the effect that all country scores add up to the total number of deals). The data are reported per billion PPP\$ GDP.

Source: Refinitiv (an LSEG business) SDC Platinum database; International Monetary Fund World Economic Outlook Database, October 2020. (<https://www.refinitiv.com/en/financial-data/deals-data/joint-venture-deals>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

5.2.5. Patent families/bn PPP\$ GDP

Number of patent families filed in at least two offices (per billion PPP\$ GDP) | 2017

A patent family is a set of interrelated patent applications filed in one or more countries or jurisdictions to protect the same invention. Patent families containing applications filed in at least two

different offices is a subset of patent families where protection of the same invention is sought in at least two different countries. In this report, “patent families data” refers to patent families containing applications filed in at least two intellectual property (IP) offices; the data are scaled by PPP\$ GDP (billions). A patent is a set of exclusive rights granted by law to applicants for inventions that are new, non-obvious and industrially applicable. A patent is valid for a limited period of time (generally 20 years) and within a defined territory. The patent system is designed to encourage innovation by providing innovators with time-limited exclusive legal rights, thus enabling them to reap the rewards of their innovative activity.

Source: World Intellectual Property Organization, Intellectual Property Statistics; International Monetary Fund, World Economic Outlook Database, October 2020. (www.wipo.int/ipstats; <https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases>).

5.3. Knowledge absorption

5.3.1. Intellectual property payments, % total trade

Charges for use of intellectual property, i.e., payments (% of total trade, three-year average) | 2019

Charges for the use of intellectual property not included elsewhere, i.e., payments (% of total trade), average of three most recent years or most recent. Value is calculated according to the Extended Balance of Payments Services Classification EBOPS 2010 – that is, code SH: Charges for the use of intellectual property not included elsewhere, as a percentage of total trade. Total trade is defined as the sum of total imports of code G goods and code SOX commercial services (excluding government goods and services not included elsewhere) plus total exports of code G goods and code SOX commercial services (excluding government goods and services not included elsewhere), divided by 2. According to the sixth edition of the International Monetary Fund's *Balance of Payments Manual*, the item “Goods” covers general merchandise, net exports of goods under merchanting and non-monetary gold. The “commercial services” category is defined as being equal to “services” minus “government goods and services not included elsewhere.” Receipts are between residents and non-residents for the use of proprietary rights (such as patents, trademarks, copyrights, industrial processes and designs, including trade secrets and franchises), and for licenses to reproduce or distribute (or both) intellectual property embodied in produced originals or prototypes (such as copyrights on books and manuscripts, computer software,

cinematographic works and sound recordings) and related rights (such as for live performances and television, cable or satellite broadcast).

Source: World Trade Organization, Trade in Commercial Services database, values based on the classification of the sixth (2009) edition of the International Monetary Fund's *Balance of Payments and International Investment Position Manual* and Balance of Payments database. (<https://www.imf.org/external/pubs/ft/bop/2007/pdf/bpm6.pdf>; www.oecd.org/std/its/EBOPS-2010.pdf).

5.3.2. High-tech imports, % total trade

High-tech imports (% of total trade) | 2019

High-technology imports as a percentage of total trade. High-technology exports and imports contain technical products with a high intensity of R&D, defined by the Eurostat classification, which is based on Standard International Trade Classification (SITC) Revision 4 and the OECD definition. Commodities belong to the following sectors: aerospace; computers and office machines; electronics – telecommunications; pharmacy; scientific instruments; electrical machinery; chemistry; non-electrical machinery; and armament.

Source: World Trade Organization, United Nations, Comtrade Database; Eurostat, *Annex 5: High-tech aggregation by SITC Rev. 4*, April 2009 (2015–19). (<http://comtrade.un.org>; http://ec.europa.eu/eurostat/cache/metadata/Annexes/htec_esms_an5.pdf).

5.3.3. ICT services imports, % total trade

Telecommunications, computer, and information services imports (% of total trade)^a | 2019

Telecommunications, computer, and information services as a percentage of total trade according to the OECD's Extended Balance of Payments Services Classification EBOPS 2010, coded SI: Telecommunications, computer, and information services. For the definition of total trade, see indicator 5.3.1.

Source: World Trade Organization, Trade in Commercial Services database, values based on the classification of the sixth (2009) edition of the International Monetary Fund's *Balance of Payments and International Investment Position Manual* and Balance of Payments database. (<https://www.imf.org/external/pubs/ft/bop/2007/pdf/bpm6.pdf>; www.oecd.org/std/its/EBOPS-2010.pdf).

5.3.4. FDI net inflows, % GDP

Foreign direct investment (FDI), net inflows (% of GDP, three-year average)^a | 2019

Foreign direct investment is the average of the most recent three years of net inflows of investment to acquire a lasting management interest (10 percent or more of voting stock) in an enterprise operating in an economy other than that of the investor. It is the sum of equity capital, reinvestment of earnings, other long-term capital, and short-term capital as shown in the balance of payments. This data series shows net inflows (new investment inflows less disinvestment) in the reporting economy from foreign investors, and is divided by GDP.

Source: International Monetary Fund, International Financial Statistics and Balance of Payments databases, World Bank, International Debt Statistics, and World Bank and OECD GDP estimates; extracted from the World Bank's World Development Indicators database, 2019 (2018–19). (<http://data.worldbank.org>).

5.3.5. Research talent, % in businesses

Researchers in business enterprise (%) | 2019

Researchers in the business enterprise sector (measured in full-time equivalence, FTE) refers to researchers as professionals engaged in the conception or creation of new knowledge, products, processes, methods and systems, as well as in the management of these projects, broken down by the sectors in which they are employed (business enterprise, government, higher education and private non-profit organizations). In the context of R&D statistics, the business enterprise sector includes all firms, organizations and institutions whose primary activity is the market production of goods or services (other than higher education) for sale to the general public at an economically significant price, and the mainly private non-profit institutions serving them; the core of this sector is made up of private enterprises.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat; OECD, Main Science and Technology Indicators (MSTI) database, March 2021 (2010–19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB).

6. Knowledge and technology outputs

6.1. Knowledge creation

6.1.1. Patents by origin/bn PPP\$ GDP

Number of resident patent applications filed at a given national or regional patent office (per billion PPP\$ GDP) | 2019

The definition of a patent can be found in the description of indicator 5.2.5. A resident patent application refers to an application filed with an IP office for or on behalf of the first-named applicant's country of residence. For example, an application filed with the Japan Patent Office by a resident of Japan is considered a resident application for Japan. Similarly, an application filed with the European Patent Office (EPO) by an applicant who resides in any of the EPO member states, for example Germany, is considered a resident application for that member state (Germany). Data are scaled by PPP\$ GDP (billions).

Source: World Intellectual Property Organization, Intellectual Property Statistics; International Monetary Fund, World Economic Outlook Database, October 2020 (2010–19). (www.wipo.int/ipstats; <https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases>).

6.1.2. PCT patents by origin/bn PPP\$ GDP

Number of Patent Cooperation Treaty applications (per billion PPP\$ GDP)^a | 2020

A PCT application refers to an international patent application filed through the WIPO-administered Patent Cooperation Treaty (PCT). The PCT system makes it possible to seek patent protection for an invention simultaneously in a number of countries by filing a single international patent application. The origin of PCT applications is defined by the residence of the first-named applicant. Data are available only for those economies which are PCT Contracting States (153 to date). Data are scaled by PPP\$ GDP (billions).

Source: World Intellectual Property Organization, Intellectual Property Statistics; International Monetary Fund, World Economic Outlook Database, October 2020. (www.wipo.int/ipstats; <https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases>).

6.1.3. Utility models by origin/bn PPP\$ GDP

Number of resident utility model applications filed at the national patent office (per billion PPP\$ GDP) | 2019

A utility model (UM) is a special form of patent right. The terms and conditions for granting a UM are slightly different from those for patents and include a shorter term of protection and less stringent patentability requirements. A resident UM application refers to an application filed with an IP office for or on behalf of the first-named applicant's country of residence. For example, an application filed with the IP office of Germany by a resident of Germany is considered a resident application for Germany. Data are scaled by PPP\$ GDP (billions).

Source: World Intellectual Property Organization, Intellectual Property Statistics; International Monetary Fund, World Economic Outlook Database, October 2020 (2010–19). (www.wipo.int/ipstats; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

6.1.4. Scientific and technical articles/bn PPP\$ GDP

Number of scientific and technical journal articles (per billion PPP\$ GDP) | 2020

The number of articles published in science and technology. This encompasses 182 different research categories belonging to research areas including engineering, chemistry, physics, environmental sciences, computer science, mathematics, biochemistry, molecular biology, oncology, agriculture, cell biology and many more. Article counts are taken from a set of journals covered by the Science Citation Index Expanded (SCIE) and the Social Sciences Citation Index (SSCI). Articles are classified by year of publication and assigned to each economy on the basis of the institutional address(es) listed in the article.

Articles are counted on a count basis (rather than a fractional basis) – that is, for articles with collaborating institutions from multiple economies, each economy receives credit on the basis of its participating institutions. The data are reported per billion PPP\$ GDP.

Source: Clarivate, Web of Science, accessed March 15, 2021; International Monetary Fund, *World Economic Outlook Database*, October 2020. (<https://clarivate.com/webofsciencegroup/solutions/web-of-science>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

6.1.5. Citable documents H-index

The H-index is the economy's number of published articles (H) that have received at least H citations | 2020

The H-index expresses the journal's number of articles (H) that have received at least H citations. It quantifies both journal scientific productivity and scientific impact, and is also applicable to scientists, journals, and so on. The H-index is tabulated from the number of citations received in subsequent years by articles published in a given year, divided by the number of articles published that year.

Source: SCImago (2021) SJR – SCImago Journal & Country Rank, retrieved March 2021. (www.scimagojr.com).

6.2. Knowledge impact

6.2.1. Labor productivity growth, %

Growth rate of GDP per person employed (% , three-year average) | 2020

Growth rate of real GDP per person employed, average of three most recent available years (2018, 2019, 2020). Growth of GDP per person engaged provides a measure of labor productivity (defined as output per unit of labor input). GDP per person employed is GDP divided by total employment in the economy.

Source: The Conference Board Total Economy Database™ Output, Labor and Labor Productivity, 1950–2020, April 2021 preliminary release. (<https://www.conference-board.org/data/economydatabase>).

6.2.2. New businesses/th pop. 15–64

New business density (new registrations per thousand population, 15–64 years old)^a | 2018

Number of newly registered corporations per 1,000 persons of working-age (15–64 years old). The units of measurement are private, formal sector companies with limited liability. Data corrections relative to the 2016 survey were implemented by the World Bank for Panama.

Source: World Bank, *Doing Business 2020, Entrepreneurship Project* (2009–18). (<https://www.doingbusiness.org/en/data/exploretopics/entrepreneurship>).

6.2.3. Software spending, % GDP

Total computer software spending
(% of GDP) | 2020

Computer software spending includes the total value of purchased or leased packaged software, such as operating systems, database systems, programming tools, utilities and applications. It excludes expenditures for internal software development and outsourced custom software development. The data are a combination of actual figures and estimates. Data are reported as a percentage of GDP.

Source: IHS Markit, Information and Communication Technology Database.
(<https://www.ihs.com/index.html>).

6.2.4. ISO 9001 quality certificates/bn PPP\$ GDP

ISO 9001 Quality management systems – number of certificates issued (per billion PPP\$ GDP) | 2019

ISO 9001 specifies requirements for a quality management system when an organization needs to demonstrate its ability to provide products and services that meet both customer and applicable statutory and regulatory requirements. It aims to enhance customer satisfaction through the effective application of the system, including processes for improving the system and ensuring conformity to customer and applicable statutory and regulatory requirements. All the requirements of ISO 9001 are generic and are intended to be applicable to any organization, regardless of its type or size, or the products and services it provides. The data are reported per billion PPP\$ GDP.

Source: International Organization for Standardization (ISO), *ISO Survey of Certifications to Management System Standards*, 2019; International Monetary Fund, World Economic Outlook database, October 2020. (<https://www.iso.org/the-iso-survey.html>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

6.2.5. High-tech manufacturing, %

High-tech and medium-high-tech manufacturing
(% of total manufacturing output) | 2018

High-technology and medium-high-technology output as a percentage of total manufacturing output, on the basis of the OECD classification of Technology Intensity Definition, itself based on International Standard Industrial Classification (ISIC) Revision 4 and ISIC Revision 3, and using data from the INDSTAT 2 database of the United Nations Industrial Development Organization (UNIDO).

Source: United Nations Industrial Development Organization (UNIDO), Industrial Statistics Database INDSTAT 2, 2020; OECD, Directorate for Science, Technology and Industry, Economic Analysis and Statistics Division, “ISIC Rev. 3 Technology Intensity Definition: Classification of Manufacturing Industries into Categories Based on R&D Intensities” (2010–18). (<https://stat.unido.org>; www.oecd.org/sti/ind/48350231.pdf).

6.3. Knowledge diffusion

6.3.1. Intellectual property receipts, % total trade

Charges for use of intellectual property, i.e., receipts (% total trade, three-year average)^a | 2019

Charges for the use of intellectual property not included elsewhere, i.e. receipts (% of total trade), average of three most recent years or most recent. Value is calculated according to the Extended Balance of Payments Services Classification EBOPS 2010 – that is, code SH: Charges for the use of intellectual property not included elsewhere, as a percentage of total trade. Receipts are between residents and non-residents for the use of proprietary rights (such as patents, trademarks, copyrights, industrial processes and designs, including trade secrets and franchises), and for licenses to reproduce or distribute (or both) intellectual property embodied in produced originals or prototypes (such as copyrights on books and manuscripts, computer software, cinematographic works and sound recordings) and related rights (such as for live performances and television, cable, or satellite broadcast). For the definition of total trade, see indicator 5.3.1.

Source: World Trade Organization, Trade in Commercial Services database, values based on the classification of the sixth (2009) edition of the International Monetary Fund’s *Balance of Payments and International Investment Position Manual* and Balance of Payments database (2010–19). (<https://www.imf.org/external/pubs/ft/bop/2007/pdf/bpm6.pdf>; www.oecd.org/std/its/EBOPS-2010.pdf).

6.3.2. Production and export complexity

The Economic Complexity Index^a | 2018

The Economic Complexity Index is a ranking of countries based on the diversity and complexity of their export basket. High-complexity countries are home to a range of sophisticated, specialized capabilities and are therefore able to produce a highly diversified set of complex products. Determining the economic complexity of a country is not solely dependent on a country’s productive knowledge. Information about how many capabilities the country has is contained not only in

the absolute number of products that it makes, but also in the ubiquity of those products (the number of countries that export the product) and in the sophistication and diversity of the products that those other countries make. Economic complexity expresses the diversity and sophistication of the productive capabilities embedded in the exports of each country.

Source: The Atlas of Economic Complexity, Growth Lab at Harvard University. (<https://atlas.cid.harvard.edu>).

6.3.3. High-tech exports, % total trade

High-tech exports (% of total trade) | 2019

High-technology exports as a percentage of total trade. See indicator 5.3.2 for details. Data for Hong Kong, China are corrected for re-exports using data from the Trade Data Monitor.

Source: World Trade Organization, United Nations, Comtrade database; Eurostat, *Annex 5: High-tech aggregation by SITC Rev. 4*, April 2009 (2015–19). (<http://comtrade.un.org>; https://ec.europa.eu/eurostat/cache/metadata/Annexes/htec_esms_an5.pdf).

6.3.4. ICT services exports, % total trade

Telecommunications, computer, and information services exports (% of total trade) | 2019

Telecommunications, computer, and information services as a percentage of total trade according to the Extended Balance of Payments Services Classification EBOPS 2010, coded SI: Telecommunications, computer, and information services.

Source: Source: World Trade Organization, Trade in Commercial Services database, values based on the classification of the sixth (2009) edition of the International Monetary Fund's *Balance of Payments and International Investment Position Manual* and Balance of Payments database (2019). (<https://www.imf.org/external/pubs/ft/bop/2007/pdf/bpm6.pdf>; www.oecd.org/std/its/EBOPS-2010.pdf).

7. Creative outputs

7.1. Intangible assets

7.1.1. Trademarks by origin/bn PPP\$ GDP

Number of classes in resident trademark applications issued at a given national or regional office (per billion PPP\$ GDP) | 2019

A trademark is a sign used by the owner of certain products or provider of certain services to distinguish them from the products or services of other companies. A trademark can consist of words or a combination of words and other elements, such as slogans, names, logos, figures and images, letters, numbers, sounds and moving images. The procedures for registering trademarks are governed by the legislation and procedures of national and regional IP offices. Trademark rights are limited to the jurisdiction of the IP office that registers the trademark. Trademarks can be registered by filing an application at the relevant national or regional office(s) or by filing an international application through the Madrid System. A resident trademark application refers to an application filed with an IP office for or on behalf of the first-named applicant's country of residence. For example, an application filed with the Japan Patent Office by a resident of Japan is considered to be a resident application for Japan. Similarly, an application filed with the Office for Harmonization in the Internal Market (OHIM) by an applicant who resides in any of the EU member states, such as France, is considered to be a resident application for that member state (France). This indicator is based on class count – the total number of goods and services classes specified in resident trademark applications. Data are scaled by PPP\$ GDP (billions).

Source: World Intellectual Property Organization, Intellectual Property Statistics; International Monetary Fund, World Economic Outlook Database, October 2020 (2012–19). (www.wipo.int/ipstats; <https://www.imf.org/en/Publications/SPROLLs/world-economic-outlook-databases>).

7.1.2. Global brand value, top 5,000, % GDP

Global brand value of the top 5,000 brands (per billion PPP\$ GDP) | 2020

Sum of global brand values, top 5,000 as a percentage of GDP. Brand Finance calculates brand value using the royalty relief methodology, which determines the value that a company would be willing to pay to license its brand if it did not own it. The methodology is compliant with industry standards set in ISO 10668. This approach involves estimating the future revenue attributable to a brand and calculating a royalty rate that would be

charged for the use of the brand. Brand Finance's study is based on publicly available information on the largest brands in the world. This indicator assesses the economy's brands in the top 5,000 global brand database and produces the sum of the brand values corresponding to that economy. This sum is then scaled by GDP. A score of 0 is assigned where there are no brands in the country that make the top 5,000 ranking. A score of n/a is assigned where Brand Finance has been unable to determine if there are brands from the country that would rank within the top 5,000 due to data availability limitations.

Source: Brand Finance database; International Monetary Fund, World Economic Outlook Database, October 2020. (<https://brandirectory.com>; <https://brandfinance.com/knowledge-centre>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

7.1.3. Industrial designs by origin/bn PPP\$ GDP

Number of designs contained in resident industrial design applications filed at a given national or regional office (per billion PPP\$ GDP)^a | 2019

An industrial design is a set of exclusive rights granted by law to applicants to protect the ornamental or aesthetic aspect of their products. An industrial design is valid for a limited period of time and within a defined territory. A resident industrial design application refers to an application filed with the IP office for or on behalf of the applicant's country of residence. For example, an application filed with the Japan Patent Office by a resident of Japan is considered to be a resident application for Japan. Similarly, an application filed with the Office for Harmonization in the Internal Market (OHIM) by an applicant who resides in any of the OHIM member states, such as Italy, is considered to be a resident application for that member state (Italy). This indicator is based on design count – the total number of designs contained in the resident industrial design applications. Data are scaled by PPP\$ GDP (billions).

Source: World Intellectual Property Organization, Intellectual Property Statistics; International Monetary Fund, World Economic Outlook Database, October 2020 (2014–19). (www.wipo.int/ipstats; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

7.1.4. ICTs and organizational model creation[†]

Extent to which ICTs enable new organizational models[†] | 2018

Average answer to the question: In your country, to what extent do ICTs enable new organizational models (e.g., virtual teams, remote working, telecommuting) within companies? [1 = not at all; 7 = to a great extent]

Source: World Economic Forum, Executive Opinion Survey 2019. (www3.weforum.org/docs/WEF_GCR_2019_Appendix_B.pdf).

7.2. Creative goods and services

7.2.1. Cultural and creative services exports, % total trade

Cultural and creative services exports (% of total trade)^a | 2019

Creative services exports as a percentage of total exports according to the Extended Balance of Payments Services Classification EBOPS 2010 – that is, EBOPS code SI3: Information services; code SJ22: Advertising, market research, and public opinion polling services; code SK1: Audio-visual and related services; and code SK23: Heritage and recreational services as a percentage of total trade. See indicator 5.3.1 for the full definition of total trade.

Source: World Trade Organization, Trade in Commercial Services database, values based on the classification of the sixth (2009) edition of the International Monetary Fund's *Balance of Payments and International Investment Position Manual* and Balance of Payments database (2011–19). (<https://timeseries.wto.org>; www.oecd.org/std/its/EBOPS-2010.pdf).

7.2.2. National feature films/mn pop. 15–69

Number of national feature films produced (per million population, 15–69 years old)^a | 2017

A feature film is defined as a film with a running time of 60 minutes or longer. It includes works of fiction, animation and documentaries. It is intended for commercial exhibition in cinemas. Feature films produced exclusively for television broadcasting, as well as newsreels and advertising films, are excluded. Data are reported per million population aged 15–69 years old.

Source: UNESCO Institute for Statistics (UIS) online database; United Nations, Department of Economic and Social Affairs, Population Division, *World Population Prospects: The 2019 Revision* (population) (2010–17). (<http://data.uis.unesco.org>; <https://population.un.org/wpp>).

7.2.3. Entertainment and media market/th pop. 15–69

Global entertainment and media market
(per thousand population, 15–69 years old)^a | 2020

The Global Entertainment & Media Outlook (the Outlook) is a comprehensive source of global analyses and five-year forecasts of consumer and advertising spending across different territories and entertainment and media segments.

The E-sports dataset has been expanded with the addition of E-sports media rights, providing a richer picture of this fast-emerging market. A number of changes have also been made to the segmentation of the Outlook to better reflect the shape of the modern entertainment and media market. The Music and Radio segments have been merged, along with the new Podcasts data, to create the new Music, radio and podcasts segment, reflecting the growing interconnectedness of the audio entertainment market. Additionally, the Video games segment has been merged with E-sports to create the new Video games and e-sports segment, capturing the close relationship between the two markets.

The figures for Algeria, Bahrain, Jordan, Kuwait, Lebanon, Morocco, Oman, Qatar, the Islamic Republic of Iran, Malta, Tunisia and Yemen were estimated from a total corresponding to Middle East and North Africa (MENA) countries using a breakdown of total GDP (current US\$) for the above-mentioned countries to define referential percentages.

Source: Calculations were derived from PwC's *Global Entertainment and Media Outlook, 2020–2024*; United Nations, Department of Economic and Social Affairs, Population Division, *World Population Prospects: The 2019 Revision* (population); World Economic Outlook Database, October 2020 (current US\$ GDP); Middle East & North Africa in the World Bank's DataBank. (www.pwc.com/outlook; <https://population.un.org/wpp>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>; <http://data.worldbank.org/region/middle-east-and-north-africa>).

7.2.4. Printing and other media, % manufacturing

Printing publications and other media output
(% of manufacturing total output)^a | 2018

Printing and reproduction of recorded media output (ISIC Revision 4 Division 18, group 181 with class 1811 and 1812 and group 182 with class 1820) as a percentage of total manufacturing output (ISIC Revision 4, section C). Where data for ISIC Revision 4 were not available, data from ISIC Revision 3 were used (ISIC Revision 3 group 222, classes 2221, 2222 and 2230).

Source: United Nations Industrial Development Organization, Industrial Statistics Database; four-digit level of International Standard Industrial Classification (ISIC) Revision 4 (INDSTAT 4 2020) and ISIC Revision 3 (2010–18). (<https://stat.unido.org>).

7.2.5. Creative goods exports, % total trade

Creative goods exports (% of total trade) | 2019

Total value of creative goods exports (current US\$) over total trade. For the definition of total trade, see indicator 5.3.1.

Source: United Nations, Comtrade database; 2009 UNESCO Framework for Cultural Statistics, Table 3, *International trade of cultural goods and services defined with the Harmonised System (HS) 2007 codes*; World Trade Organization, Trade in Commercial Services database, itself based on the sixth (2009) edition of the International Monetary Fund's *Balance of Payments and International Investment Position Manual* and Balance of Payments database (2012–19). (<http://comtrade.un.org>; <https://unstats.un.org/unsd/statcom/doc10/BG-FCS-E.pdf>; https://www.wto.org/english/res_e/statis_e/tradeserv_stat_e.htm; <https://www.oecd.org/sdd/its/EBOPS-2010.pdf>).

7.3. Online creativity

7.3.1. Generic top-level domains (TLDs)/th pop. 15–69

Generic top-level domains (TLDs) (per thousand population, 15–69 years old) | 2020

A generic top-level domain (TLD) is one of the categories of TLDs maintained by the Internet Assigned Numbers Authority (IANA) for use on the Internet. Generic TLDs can be unrestricted (.com, .info, .net and .org) or restricted – that is, used on the basis of fulfilling eligibility criteria (.biz, .name and .pro). Of these, the statistic covers the five generic domains .biz, .info, .org, .net and .com. Generic domains .name and .pro, and sponsored domains (.arpa, .aero, .asia, .cat, .coop, .edu, .gov, .int, .jobs, .mil, .museum, .tel and .travel) are not included. Neither are country-code top-level domains (refer to indicator 7.3.2). The statistic represents the total number of registered domains (i.e., net totals by December 2020, existing domains + new registrations – expired domains). Data are collected on the basis of a 4 percent random sample of the total population of domains drawn from the root zone files (a complete listing of active domains) for each TLD. The geographic location of a domain is determined by the registration address for the domain name registrant that is returned from a whois query. These registration data are parsed by country and

postal code and then aggregated to any number of geographic levels, such as county, city or economy. The original hard data were scaled by thousand population, 15–69 years old. For confidentiality reasons, only normalized values are reported; while relative positions are preserved, magnitudes are not.

Source: ZookNIC Inc; United Nations, Department of Economic and Social Affairs, Population Division, *World Population Prospects: The 2019 Revision* (population). (www.zooknic.com; <https://population.un.org/wpp>).

7.3.2. Country-code TLDs/th pop. 15–69

Country-code top-level domains (TLDs) (per thousand population, 15–69 years old) | 2020

A country-code top-level domain (TLD) is one of the categories of TLDs maintained by the Internet Assigned Numbers Authority (IANA) for use on the Internet. Country-code TLDs are two-letter domains especially designated for a particular economy, country or autonomous territory. The statistic represents the total number of registered domains (i.e., net totals by December 2020, existing domains + new registrations – expired domains). Data are collected from the registry responsible for each country-code TLD and represent the total number of domain registrations in the country-code TLD. Each country-code TLD is assigned to the country with which it is associated rather than based on the registration address of the registrant. ZookNIC reports that, for the country-code TLDs it covers, 85–100 percent of domains are registered in the same country; the only exceptions are the country-code TLDs that have been licensed for worldwide commercial use. Data are reported per thousand population, 15–69 years old. For confidentiality reasons, only normalized values are reported; while relative positions are preserved, magnitudes are not.

Source: ZookNIC Inc; United Nations, Department of Economic and Social Affairs, Population Division, *World Population Prospects: The 2019 Revision* (population). (www.zooknic.com; <https://population.un.org/wpp>).

7.3.3. Wikipedia edits/mn pop. 15–69

Wikipedia yearly edits by country (per million population, 15–69 years old) | 2020

Data extracted from Wikimedia Foundation's internal data sources. For every country with more than 100,000 edit counts in 2020, the data from 2020 are used. Data are reported per million population, 15–69 years old. Data from China are treated as missing and classified as “n/a.”

Source: Wikimedia Foundation; United Nations, Department of Economic and Social Affairs, Population Division. *World Population Prospects: The 2019 Revision* (population). (<https://wikimediafoundation.org>; <https://esa.un.org/unpd/wpp>).

7.3.4. Mobile app creation/bn PPP\$ GDP

Global downloads of mobile apps (scaled by per billion PPP\$ GDP) | 2020

Global downloads of mobile apps, by origin of the headquarters of the developer/firm, scaled by PPP\$ GDP (billions). Global downloads are compiled by App Annie Intelligence, public data sources and the company's proprietary forecast model based on data from Google Play Store and iOS App Store in each country between January 1, 2020 and December 31, 2020. Since data for China are not available for Google Play Store and only for iOS App Store, data from China are treated as missing and classified as “n/a.”

Source: App Annie Intelligence; International Monetary Fund, *World Economic Outlook Database*, October 2020 (2016–20). (<https://www.appannie.com>; <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>).

Appendix IV

Global Innovation Index science and technology cluster methodology

Since 2016 the Global Innovation Index (GII) has sought to identify Science and Technology (S&T) clusters using a bottom-up approach. This approach disregards administrative or political borders and instead pinpoints those geographical areas showing a high density of inventors and scientific authors. The resultant clusters often encompass several municipal districts, sub-federal states, and sometimes even two or more countries.

The same methodology used in previous editions of the GI was employed in the compilation of this year's list of the top 100 GI S&T clusters worldwide (Bergquist and Fink, 2020: 43–63). It comprised:

- selecting inventors listed in published patent applications under WIPO's Patent Cooperation Treaty (PCT) spanning the period 2015 to 2019;
- selecting authors listed in scientific publications in the Web of Science's Science Citation Index Expanded (SCIE) covering the same period;
- geocoding inventor and author addresses and then applying the density-based spatial clustering of applications with noise (DBSCAN) algorithm to the geocoded inventor and author points.

The WIPO PCT patent dataset consists of approximately 1.1 million patent applications published between 2015 and 2019 containing 3.2 million inventor addresses. For the SCIE, the dataset comprises 9.1 million articles published during the same period containing 27.7 million listed author addresses.

The geocoding of addresses for this report is as follows. PCT inventor addresses were geocoded using the Environmental Systems Research Institute (ESRI) ArcGIS World Geocoder service.¹ When the ESRI address matches proved either insufficiently accurate or ambiguous, the city name in the address string was extracted and matched using records in the city level dataset from the GeoNames Gazetteer database.² This latter database gives the geolocation of cities around the globe and contains 48,000 geocoded cities. This same city matching approach was applied to all SCIE author addresses.

Overall, 96.4% of inventor addresses were geocoded at either the city level or a more accurate level, while 95.5% of scientific author addresses were geocoded at the city level. Annex Table 5 provides a summary of the geocoding results for the top 20 countries, which together account for the majority of inventor and scientific author addresses. As shown in the table, the coverage of geocoded addresses across all 20 countries is typically above 95%, only falling below 90% in one instance.

Addresses were clustered by applying the DBSCAN algorithm. This algorithm requires pre-defined radius and density parameters. As in previous years, a radius of 15 km and a density of 4,500 was applied. Equal weight was given to inventors and authors by expressing data points as a share of total inventor and author addresses, respectively. Given that the number of scientific articles far exceeds the number of patents, cluster identification based on the raw data points would have resulted in clusters shaped predominantly by the scientific author landscape.

The result was an initial list of 227 clusters. After review, neighboring clusters were merged if the edge of a cluster was within 3–5 km of another and where the co-author/co-inventor relationships were higher than they were for any other relationship with any other cluster or non-cluster points. A total of 22 clusters met these criteria, mergers reducing the overall number of clusters identified to 216.³

The remaining 216 clusters were then put into rank by counting the number of patents and scientific articles in a given cluster. Numbers were aggregated utilizing fractional counting, where counts reflect the share of a patent's inventors and an article's authors present in a particular cluster. In addition, mirroring the equal weighting approach described above, fractional counts are relative to the total numbers of patents and scientific articles.

To produce an intensity ranking, the European Commission's Global Human Settlement Layer (GHSL) population distribution data were matched geographically to the top 100 clusters identified in the overall ranking. Just as with inventor/author geocoded locations, this population data allowed us to define the total population of a cluster using a bottom-up approach. We chose to delimit a cluster's area as being all the space within 0.05 degrees of each inventor/author location. Overlaying the resultant cluster polygons on top of the population data and aggregating all points which lay within the polygon gave a total population estimate for each cluster.⁴ The clusters were then ranked by dividing the total S&T share by population.

Annex Table 3
Top 100 clusters, 2021

Cluster rank	Cluster name	Economy	Share of total PCT filings (%)	Share of total publications (%)	Total	Rank change

Note: Listed are the top 20 countries with the highest combined shares of scientific articles and patents. PCT inventor addresses were geocoded to the highest level of detail. Due to the far larger volume of scientific author addresses, these were geocoded only to city level. DEA is Data Envelopment Analysis.

The Global Innovation Index 2021

The Global Innovation Index 2021 (GII) takes the pulse of the most recent global innovation trends and ranks the innovation ecosystem performance of 132 economies, while highlighting innovation strengths and weaknesses and particular gaps in innovation metrics.

As this report goes to press, the world is struggling to cope with the COVID-19 pandemic. In its new Global Innovation Tracker section, the report draws on a select set of indicators, including the effects on research and development expenditures or access to innovation finance, to provide a perspective on the pandemic's impact on global innovation performance.

Since its inception in 2007, the GI has shaped the innovation measurement agenda and become a cornerstone of economic policymaking, with an increasing number of governments systematically analyzing their annual GI results and designing policy responses to improve their performance. The GI has also been recognized by the UN Economic and Social Council in its 2019 resolution on Science, Technology and Innovation for Development as an authoritative benchmark for measuring innovation in relation to the Sustainable Development Goals (SDGs).

The GI is published in partnership with the Portulans Institute, the Confederation of Indian Industry (CII), the Brazilian National Confederation of Industry (CNI), Ecopetrol and the Turkish Exporters Assembly (TIM) and is supported by its GI Advisory Board and Academic Network.

The full report and the GI mobile apps – Android and iOS – can be downloaded at <https://globalinnovationindex.org>.
