MARA FORENSICS

Collect only what the matter needs. Remotely or in person. Verified end to end.

MARA is a patent-pending platform for collecting messages, calls and contacts from iPhone and Android phones, without shipping devices or sending an examiner on site. The legal team sets the scope, the custodian collects from their own computer, and every delivery is hash-verified.

Who it is for

- Law firms
- Corporate legal & compliance
- Internal & insider-threat investigations
- Forensic & eDiscovery service providers

What MARA does

Remote collection

A private invitation from the MARA portal. The custodian installs the MARA collection app on their Windows or Mac computer, connects their phone and follows guided steps. No kit, no shipping, no site visit.

Targeted Pro: only what matters

The legal team sets data types and date range. The custodian confirms the specific relevant conversations on their own computer, and only those are delivered. Nothing else leaves the phone.

Remote Signal collection

Signal keeps its messages out of ordinary phone backups. MARA collects Signal remotely from the custodian's own computer, limited to the conversations and dates the legal team set.

In person, too: Collect Now

When the phone is already in the office, Collect Now runs the same workflow on the team's own computer and produces the same verified package and report.

Verified chain of custody

Every upload is checked against its full-file SHA-256 before it is marked complete. Downloads are pinned to the verified version, and each collection comes with a Collection and Delivery Report.

Storage ready, or your own

Collections go to MARA's encrypted storage out of the box, or straight to the client's own Amazon S3 bucket or Azure Blob Storage account, in the region they choose.

Scope stays with the legal team

The litigation or investigations team, or their forensic examiner, defines the matter, the data categories (messages, calls, contacts) and the date range. The custodian cannot widen or change them. That makes a proportional, defensible collection the default and gives custodians a reason to say yes.

A remote collection in four steps

1

Invite

The legal team creates the matter and scope in the MARA portal and sends the custodian a private invitation.

2

Collect

The custodian connects their phone to their own Windows or Mac computer. MARA guides each step in plain language.

3

Verify

The package is uploaded and checked against its full-file hash before it is marked complete.

4

Review & export

Open it in MARA Review, or export it from the portal for your review platform.

Export for eDiscovery

Verified Targeted Pro collections export directly from the MARA portal, ready to load into the review platform the team already uses.

- **RSMF 2.0**, one file per conversation per day
- **Excel** workbook with a sheet per conversation
- **XML** with load-file-style attachments
- Quick look and search before export, and the custodian's name mapped for review
- A QC report and a SHA-256 manifest in every package

Export for full collections is coming in the next release of the MARA collection app.

MARA Review

A local Windows and Mac review application that opens each collection on the reviewer's own computer, so evidence does not have to be hosted to be read. Conversations display as threads, with reports and exports, including PDF and RSMF.

At a glance

Phones	iPhone and Android, collected through a Windows or Mac computer; on-phone collection with the MARA Android app
Data	Messages, calls, contacts and chat apps, including iMessage, WhatsApp and Signal, with attachments
Targeted Pro	Available now on Windows for iPhone and Android custodians; Mac coming soon
Storage	MARA encrypted storage by default; customer-owned Amazon S3 or Azure Blob Storage, with built-in connection and integrity testing
Delivery model	SaaS portal managed by MARA, with optional customer-owned storage
EDRM stages	Identification, Preservation, Collection, Processing (mobile), Review (local)

About MARA Forensics

MARA Forensics builds remote mobile evidence collection and review software. The company was founded by Jeremy Horowitz, a former Big Four digital forensics professional and former New Jersey cybercrime detective who specialized in digital forensics, and is based in Ramsey, New Jersey. The MARA platform is patent pending.
